*Research involving materials (data, documents, records, or specimens) that have been collected, or will be collected solely for nonresearch purposes (such as medical treatment or diagnosis). (NOTE: Some research in this category may be exempt from the HHS regulations for the protection of human subjects. 45 CFR 46.101(b)(4). This listing refers only to research that is not exempt.)*

This study's approval will expire on September 15, 2016. Should you require an extension beyond the approval period, you must submit a request to the IRB by **July 15, 2016**. If approval expires, research activities must stop, and no new subjects may be enrolled in the study. Study Status Report forms can be obtained in IRBNet via the Forms and Templates library.

Before any publications are published, you must submit a copy or report of your finding to the IRB Chairperson.

This preliminary determination will be reviewed at the next full IRB meeting. Your attendance is not required.

Thank you for submitting your protocol to the HMCIRB. The Board wishes you well in your investigational endeavors.

Sincerely,

Harland Verrill Ph.D.

Chair, Institutional Review Board

This letter has been electronically signed in accordance with all applicable regulations, and a copy is retained within Hurley Medical Center's records.

**Subject:** RE: IRBNet Board Action

Senator Ananich/Andy,

Bob was out of the office last week but is in now and he has committed to finishing his part for the Hurley study and sending it on to the State Institutional Review Board (IRB) for action as quickly as possible (assuming no further information is needed from the researcher). Protecting the rights and welfare of those who participate in research is the responsibility of the State IRB, housed within MDHHS. If living humans are involved in a systematic collection or analysis of data with the intent to generate new knowledge state IRB approval is required. The researcher indicates they have the Hospital IRB approval and I do believe the state IRB will approve as well.

We have communicated with the MDHHS IRB to ensure a quick response on their part as well. We anticipate the completion of both processes by mid to late next week.

I will call you on our conversation at the Opioid Task Force meeting. As you can imagine, this is also a priority for us.

Nick

Hi Nick,

Attached is a request from a local pediatrician who is trying to identify some lead level trends in Flint. She said there was a delay in getting a response because a DHHS employee was out of the office. Because of the ongoing lead issues in Flint I am doing everything I can to ensure we are helping citizens. Any assistance you can give to move this issue quickly I would really appreciate it.

Thank you,

Andy

Bob, I just received IRB approval to look at the City of Flint blood lead levels. I would love to get the raw data if that is possible. Attached is my study proposal and the IRB approval.

Specific fields that we are looking for include:  
MCIR ID or some sort of identifier  
Zip code  
Date of Birth  
Date of Blood lead level  
Lead level

Would greatly appreciate your assistance! Thanks!

## GONGWER:

### Flint Blood Lead Survey Results Released By State

Since October 1, data indicates that 30 adults and children of 1,361 tested in Flint had elevated blood lead levels, the state said Thursday in releasing its first report as part of the state's efforts to assist in resolving the Flint water crisis.

The state called on helping the city deal with health issues as part of its efforts to restore safer drinking water to the city.

In October, after more than a year of the city getting its drinking water from the Flint River - it ended a contract with the Detroit Water and Sewerage System largely over cost issues and is working on a new water system that will draw from Lake Huron - and after more than a year of complaints on taste, smell and safety of the water, the city switched back to Detroit water when it was discovered lead levels in some children were elevated because of the water system.

In the report, the Department of Health and Human Services said 969 children were tested and 21 showed elevated lead levels. Another 392 adults were tested and nine had elevated levels.

The report also showed the number of Flint children with higher lead levels declined during the summer months this year - lead levels tend to be higher in the summer, the report said - to 6.4 percent from 7.5 percent a year ago.

However, in 2013, before the city switched from Detroit water to the Flint River, the percentage stood at 4.1 percent. That was down from percentages as high as 8.3 percent in 2010.

### House Republicans Sign Letter Urging Disapproval Of Planned Parenthood Grant

About 30 House Republicans on Thursday signed a letter asking the State Administrative Board not to approve a \$1.2 million grant increase to Planned Parenthood because it goes against the "spirit" of a budget amendment adopted this year.

On December 8, the Finance and Claims Committee of the State Administrative Board will take up a grant increase for Planned Parenthood of Mid and South Michigan. The increase will come from the restricted dollars in the Maternal Children's Health Fund (8 percent); federal funding (35 percent); fees generating through the clinic (49 percent) and local dollars (8 percent).

Rep. Gary Glenn (R-Midland), joined by Rep. Thomas Hooker (R-Byron Center), who sponsored the budget amendment saying the state will not allocate funding to Planned Parenthood, Rep. Tom Barrett (R-Pottersville), Rep. Lee Chatfield (R-Levering) and Rep. Laura Cox (R-Livonia), among others, are urging the grant to not be increased.

"We believe this is a clear violation of the spirit of the budget amendment that was voted on and passed by the Legislature during the last appropriations process," the letter reads.

Rep. Al Pscholka (R-Stevensville), chair of the House Appropriations Committee, said the grant increase does not go against the budget.

When the amendment was adopted, House Speaker Kevin Cotter (R-Mount Pleasant) said no clinics would lose money because of the amendment. He said during the last two budgets Planned Parenthood had not received any state dollars (See Gongwer Michigan Report, April 28, 2015).

The committee is scheduled to meet at 11 a.m. on December 8.

## **Appointments By The Governor**

**GOVERNOR'S TASK FORCE ON CHILD ABUSE AND NEGLECT:** Tana Bridges of Canton succeeds Gary Anderson to represent health and mental health professionals; John Hohman Jr. of Saline succeeds Kenneth Tacoma to represent judges and attorneys; and Veda Thompkins of Detroit succeeds Larry Watkins, who resigned, to represent the law enforcement community.

Robinjit Eagleson of East Lansing, Fred Gruber of Riverview and Nick Lyon of Lansing are reappointed. Ms. Thompkins will serve the remainder of a term expiring December 31, 2016. The remaining terms, which are not subject to the advice and consent of the Senate, expire December 31, 2018.

**MENTAL HEALTH DIVERSION COUNCIL:** Milton Mack of Wayne succeeds John Hohman Jr., who resigned, to represent the State Court Administrative Office for the remainder of a term expiring January 30, 2016. The appointment is not subject to the advice and consent of the Senate.

Flint water still unsafe without lead filters, professor says (Flint Journal, 12/4/2015)

## **MIRS:**

### **Group Of House R's Object To Planned Parenthood Grant Increase**

Conservatives opposed to government funding for Planned Parenthood could see a test in Michigan this month as the state considers a proposed grant increase for the organization.

Already, 29 House Republicans have signed a letter asking a state administrative committee to reject a \$1.2 million increase.

The proposed increase is on the agenda for the Dec. 8 meeting of Finance and Claims Committee, which makes recommendations on large grants to the State Administrative Board.

According to the agenda, the committee will consider a \$1.2 million increase to a one-year grant agreement with Planned Parenthood of Mid and South Michigan to provide family planning services.

The grant is under the Department of Health and Human Services (DHHS). The new total for the grant would be \$10.0 million.

According to Jennifer **EISNER**, spokesperson for DHHS, the contract amendment involves family planning services funded by federal dollars.

Because of that, she said the agreement doesn't go against language put in the current year budget that bans the department from contracting with abortion providers for services funded by state dollars.

However, a group of House Republicans doesn't see it the same way.

"We believe this is a clear violation of the spirit of the budget amendment that was voted on and passed by the Legislature during the last appropriation process," reads a letter signed by Rep. Gary GLENN (R-Midland).

Of the increase in question, 8 percent of the dollars is restricted funds from the Maternal Children's Health Fund, Glenn said. That money comes from restricted federal funds.

But Glenn noted that the state still has the discretion in this instance on whether to spend them.

Frequently a topic of political debate, Planned Parenthood has been under increased scrutiny this year, after a series of covert videos taken of Planned Parenthood employees allegedly discussing the sale of aborted baby parts. A top Planned Parenthood official has said the videos in question have been edited to "shock and deceive" the public.

According to the agenda, the Finance and Claims Committee will meet at 11 a.m. Dec. 8 inside the Michigan Library and Historical Center.

## **2% Of Flint Adults, Children Have Elevated Blood Lead Levels**

Preliminary data indicates that 30 of 1,361 adults and children tested in Flint since Oct. 1 had elevated blood lead levels, according to a report issued today by the Michigan Department of Health and Human Services.

This marks the first summary report on lead testing called for in the state's action plan related to health concerns about Flint's water infrastructure.

"Our goal is to help families reduce their exposure to lead sources," said Dr. Eden **WELLS**, MDHHS chief medical executive. "We have made progress in testing and identifying those with elevated blood lead levels, and the department will continue to work closely with the Genesee County Health Department to reach these families. We will remain diligent in our ongoing outreach and education efforts."

Tests showed that 21 of 969 children age 17 or younger and nine of 392 adults over the age 18 were identified with elevated blood lead levels.

Rep. Sheldon **NEELEY** (D-Flint) said he believes the numbers would be higher, but it's likely the lead-laced water had already been soaked into the brains and bones of some of those tested.

## **Gubernatorial Appointments**

Gov. Rick **SNYDER** today announced the following appointments and reappointments:

### **Governor's Task Force On Child Abuse And Neglect**

- Tana BRIDGE, of Canton, was appointed to a three-year term expiring Dec. 31, 2018. She is a professor of social work, as well as director of the master's program at Eastern Michigan University, represents health and mental health professionals and replaces Gary ANDERSON.
- John HOHMAN Jr., of Saline, was appointed to a three-year term expiring Dec. 31, 2018. He is the owner of Hohman ADR, an alternative dispute resolution service, represents judges and attorneys and replaces Kenneth TACOMA. Hohman will serve as chair.
- Veda THOMPSON, of Detroit, was appointed to the remainder of a three-year term expiring Dec. 31, 2016. She is the president of Families On The Move, Inc., represents the law enforcement community and fills the vacancy created by the resignation of Larry WATKINS.
- Robinjit EAGLESON, of East Lansing, was reappointed to a three-year term expiring Dec. 31, 2018. She is a management analyst for the state court administrative office and continues to represent judges and attorneys.
- Fred GRUBER, of Riverview, was reappointed to a three-year term expiring Dec. 31, 2018. He is the co-founder and executive director of Michigan Children's Law Center and continues to represent child advocates.
- Nick LYON, of Lansing, was reappointed to a three-year term expiring Dec. 31, 2018. He is the director of the Department of Health and Human Services.

### **Mental Health Diversion Council**

- Milton MACK, of Wayne, was appointed to the remainder of a four-year term expiring Jan. 30, 2016. He is the state court administrator of the Michigan Supreme Court, represents the State Court Administrative Office and fills the

vacancy created by the resignation of John HOHMAN Jr.

Wes is away from his desk but I asked staff. We do not have the final reports from the 5 completed EBLs from ETC as yet. It takes several days to get analytical results from the lab on the dust, soil and water samples. But field staff are definitely finding lead paint and other lead-containing hazards at the homes. Will have to wait and see on the water samples, but I'll get back to you when we have more results.

We do have a completed report for the Flint home where the dogs were lead poisoned: water samples were 4 ppb unfiltered kitchen tap, 8 ppb main bathroom, 100-300 ppb in outside faucet, and over 7000 ppb in an indoor basement tap. There was also lead paint and dust hazards.

Flint

1 Galvanizing is creating a problem.

More than 80 tests from DEQ-lead. Result of galvanizing copper and solder in the pipes. (DM checking with Wyant.)

Lead is probably a result of the pipes from street to house.

Pictures.

2 Incidents of a compromised system. Decreased oxygen in water. Increased anemia and other health issues. (Update on legionnaires (hospital)).

3 Copper in the water. Risk?

4. Talk to Dan about potential increase lead testing....we care.

Higher levels of Chlorine. Gam won't use. Pipes replaced for GM

Why does the letter we send out talk about not using the water. (Only sent to certain groups). Letter came from the state.

---

**Modified:**

Fri 11/20/2015 8:40 AM

For Friday

Plusses and Minuses for CHECC Activation

Chart of all lead tests by zip code (preferably disclosing all data even when number is small) and date.

EBL results by range, as specific as possible, by zip code as well - If not at least what we are seeing on the high range. I am presuming that no one has recently tested at a level where chelation is the recommended treatment.

Actual written protocol/practice guideline of what the medical community or the LPHD is supposed to do for ebl's above 5. If I recall correctly the recommended action doesn't change even if the levels are in the next range up.

The actual numbers we used for the "association" of the increase in our original press conference for the two zip codes.

The numbers that support the "doubling" quotes that I see in the newspaper, if we know. (i.e. Did the number of children who tested positive increase from 10 to 20 in one zipcode over one quarter.)

How many lead environmental tests do we do in homes each year, and how many are ongoing at any one time. How do we prioritize?

How many will we be able to do in Flint? How many are attributable to the supplemental?

When do we expect our first results?

What are we doing with the health plans?

Nancy - Emails on testing.

**Attachments:** L 15-73.pdf

Mark – Here's the L Letter we sent last week to Medicaid providers.

The approach we discussed would be beneficial to those you cover in Flint. We have stepped up our testing, outreach, and education efforts with the local public health department in a very significant way since it became apparent that there was an increase in children testing above the 5 micrograms level. As we discussed we have also begun doing home blood lead investigations with the supplemental funding approved late last year. I think a critical component going forward will be care coordination with children (and adults) who test above the threshold,

Below are examples of what some of our Medicaid Health Plans have been doing:

- Encouraging testing of all children 0-6 who had not been tested since April, 2014.
- Initiating lead poisoning awareness campaigns.
- Dedicating a n

Per your request during our call last week, I am forwarding a more detailed update on our community, member, and provider outreach efforts in Flint to encourage lead testing for all children between the ages of 0-6 that have not received a test since April 2014. Molina has identified approximately 3,500 enrolled children that require a lead test. Molina has committed to a minimum of 10-15 lead poisoning awareness and testing campaign events in partnership with local elementary schools and community agencies over the next 90 days. Molina will support these events by arranging for a nurse to administer lead tests. The health department will also provide nurses for testing, nutritional, and environmental awareness education for certain partnered events. We will send a member invitation via direct mail to targeted Molina households in surrounding zip codes for each event to encourage participation. Our case managers and community connectors (e.g. community health workers) have also been trained and engaged to develop care coordination and nutrition counseling interventions for children with blood lead levels >5. Here is a more detailed snapshot of planned community/provider activities:

#### Ø Community Engagement and Awareness

##### Four Confirmed Events in January

- ü Freeman Elementary lead testing event (1/12)
- ü Hurley Hospital w/ Genesee schools (Mid-January)
- ü Collaboration on lead screening education with Genesee Health Department at GPHO - Attend January Practice Managers meetings AM/PM sessions
- ü Genesys Residency Clinic event-Downtown Flint (1/21) - (GHPO represents 853 Providers, 21, 350 MHM Members)
- ü Eisenhower Elementary lead testing event (1/21-1/26)

##### Events in February - TBD

- ü Carriage Town Ministries Lead Testing Focused Family fun Night (2/4 & 2/8)
- ü Hamilton FQHC (TBD)
- ü Joint events with Hurley Hospital staffed by PMC physicians to provide Lead Screenings and Patient education
- ü Flint Public Schools – 3-4 events
- ü Boys and Girls Club
- ü YWCA and YMCA
- ü Flint Children's Museum

##### Events in March - TBD

ü Flint Public Schools - 2 -3 elementary school events ü Northwestern High School- Family night event ü Genesee Chamber of Commerce 1-2 events ü Grace Emmanuel Church ü Hamilton FQHC family fun and health fair event 1-2 events ü Close in on children ages 0-6 who have not yet been tested- announce innovative testing methods (mobile unit? Sponsor/Fund Traveling Nurse to elementary school) to close the gap; quotes from MHM leadership and Health Department Leaders included.

Four targeted press releases:

ü December 22 - Molina –Genesee County Health Department – Joint Press Release 1: Addressing Lead Poisoning Awareness and Prevention campaign-will include quotes from MHM and Health Department leaders; Will include details of the first four lead testing events to be hosted by MHM and Genesee County Health Department  
ü Press Release 1 will be distributed to media by 12/22/15; draft for review ready for MHM leaders 12/21/15  
ü February 1 -4 Carriage Town Ministries Lead Testing Event- Joint Media Advisory Joint Media Advisories to all Flint media detailing lead testing event at Carriage Town Ministries 2/4  
ü February 10-13 Molina –Genesee County Health Department – Joint Press Release 2: Highlight results to date including amount of lead tests performed since campaign launch, engage the public and remind them the campaign continues and that children still have many options to get a free lead test. Detail MHM- Genesee Health Department Feb 10- March 31 Lead testing events schedule; quotes from Molina and Health Department Leaders  
ü March 31- Press Release 3: Close in on children ages 0-6 who have not yet been tested- announce innovative testing methods (explore deploying traveling Nurse to elementary school) to close the gap;

Ø Provider Engagement and Awareness

ü 12/23/15 - Fax blast to all Genesee County PCPs about Lead Awareness and specific steps to ensure testing and treatment ü 12/29/15 – Fax blast to Genesys PHO ü Adding several Lead education articles and MDHHS links to additional provider/patient materials to our provider portal ü There are approximately 165 physicians serving the children of Flint – Molina has identified the top 16 providers serving at least 100 Molina children in the Flint area, which include Hurley and Hamilton FQHC. We have developed a workplan to aggressively engage these providers ü Key provider Lead awareness partners – Scheduling underway for additional January-March events:

- Genesee Health Department
- Genesee Health Plan (GHP)
- Genesys PHO
- Hurley/PMC
- Hamilton FQHC

Ø Molina HealthCare of Michigan is also working to partner/coordinate efforts with three other payers (BCBSM, United, McLaren) who also have members in Flint to ensure the entire community is included in the awareness and testing efforts

Subject: Numbered Letter L 15-73

Attached for your information is letter L 15-73, dated December 30, 2015.

L 15-73 – Blood Lead Guidelines to Address the City of Flint Residents’ Potential Exposure to Lead.

This letter was sent to Practitioners, Clinics, Laboratories and Maternal Infant Health Program (MIHP) Providers in the City of Flint.

Medicaid Letters can be accessed on the web at [www.michigan.gov/medicaidproviders](http://www.michigan.gov/medicaidproviders) >> Communication and Training >> Click 2015 under Numbered Letters.

December 30, 2015

<Provider Name>  
<Provider Address1>  
<Provider Address2>  
<Provider City> <state> <zipcode5>-<zip4>

Dear Provider:

**RE: Blood Lead Guidelines to Address the City of Flint Residents' Potential Exposure to Lead**

Michigan Medicaid Early Periodic Screening, Diagnosis and Treatment (EPSDT) guidelines require children to be tested for blood lead poisoning at 12 and 24 months of age, and between 36 and 72 months of age if the child has not been previously tested as indicated by the Medicaid Provider Manual. The Manual is located at: [www.michigan.gov/medicaidproviders](http://www.michigan.gov/medicaidproviders) >> Policy and Forms.

Due to the enhanced public health issue of an increased risk for lead exposure in the City of Flint, providers have been advised to follow enhanced guidelines for lead testing in children:

- Providers should screen ALL children (regardless of Medicaid/insurance status) between 0 and 6 years of age that may have been exposed to the City of Flint drinking water after April 2014. Note: This includes all children less than 1 year of age and children between 3 and 6 years of age.
- If the child has already been screened since April 2014 by a capillary test, providers should follow-up on any elevated levels greater than 5 mcg/dl to ensure confirmatory venous testing is conducted.
- Providers should utilize the standard Blood Lead Level (BLL) Quick Reference for Primary Care Providers located at: [www.mi.gov/documents/deq/ProviderQuickReference\\_Sept2015\\_501831\\_7.pdf?20151204122739](http://www.mi.gov/documents/deq/ProviderQuickReference_Sept2015_501831_7.pdf?20151204122739).
- All clients with blood lead levels greater than 5 mcg/dl should be referred for case management coordinated through the Genesee County Health Department.
- Providers should inquire about the use of a drinking water filter and/or bottled water by all clients residing within the Flint city limits.
- Providers should inquire about other potential sources of lead within the household per the current recommendations of the Childhood Lead Poisoning Prevention Program's Statewide Lead Testing/Lead Screening Plan. The Statewide Lead Testing/Lead Screening Plan is located at: [www.michigan.gov/documents/mdch/testing-screening071009\\_287511\\_7.pdf](http://www.michigan.gov/documents/mdch/testing-screening071009_287511_7.pdf).

Lead testing performed using these enhanced testing guidelines is covered as a Medicaid EPSDT service. Providers should contact the beneficiary's Medicaid health plan for additional assistance if needed. Any questions regarding this letter should be directed to Provider Inquiry, Department of Health and Human Services, P.O. Box 30731, Lansing, Michigan 48909-8231, or e-mail at [ProviderSupport@michigan.gov](mailto:ProviderSupport@michigan.gov). When you submit an e-mail, be sure to include your name, affiliation, and phone number so you may be contacted if necessary. Providers may phone toll-free 1-800-292-2550.

Sincerely,

A handwritten signature in black ink, appearing to read "Chris Priest", with a stylized flourish at the end.

Chris Priest, Director  
Medical Services Administration

The goal: Assess the extent of the elevated blood lead levels – the number of those affected and the degree to which they're affected <!--[if !supportLists]-->n <!--[endif]-->Get as many people in the affected zip codes tested as possible – can the Red Cross or some other agency with a bus or mobile unit set up for folks to give blood convert over to blood level testing and go into neighborhoods that have low testing rates?  
<!--[if !supportLists]-->n <!--[endif]-->A public health friend of mine said that Genesee County Health workers are stressed to the max. Can we deploy appropriate personnel from other county health agencies to help with inspecting

homes for possible other causes? In other words, it won't do any good to invest more in water infrastructure if we're finding window sills with teeth marks. I say this NOT to downplay the role that water lead levels may have played. But can we get Habitat for Humanity, for example, to do a massive volunteer effort to eradicate lead paint in homes ... or is that beyond their expertise?

<!--[if !supportLists]-->n <!--[endif]-->Gather experts to assess exactly how extensive the problem is and potential causes. And then convey this in a much more accessible ways. If you want blood level data, you have to scroll down on the DHHS web site, find the headline and then read a long press release. Maybe we're conveying this information better on the ground, but if not, we need to communicate conclusive findings in multiple ways— graphics, video, informational photo galleries and maybe even a “test” that residents can take to see if their home is at risk in other ways. I know that sounds awfully MLive-ish, but it can be effective.

Team:

Today Harvey and I met with the Flint Water Task Force. It was a good meeting. People were pleased with the G's statement from the prior day. Captain Kelenske joined us and we had a very good discussion about moving forward with the creation of the Flint Water Crisis Agency Coordinating Committee (FIACC). Tim Becker and Captain Kelenske provided me with a fair amount of input. I also read the City of Flint Incident Action Plan for a State of Emergency which Chris received today (enclosed for those who wish to read it as well). I have distilled all of this into a two page plan that I want your edits and comments on and a one page organizational chart (now presented in the “governor's colors” according to our fine people in Communications). Spoiler alert—I made Captain Kelenske Vice Chair of the whole shebang (with the Colonel's blessing) so Harvey wouldn't get lonely.

Here is my ask of you:

<!--[if !supportLists]-->1) <!--[endif]-->Within 24 (sooner if you can) hours give me your comments and input

<!--[if !supportLists]-->2) <!--[endif]-->Tomorrow I will turn around a final document for Jarrod to review with the Governor either New Year's Day or Saturday

<!--[if !supportLists]-->3) <!--[endif]-->Ideally, Governor will approve Harvey sending it to Mayor Weaver Saturday (Sunday latest)

<!--[if !supportLists]-->4) <!--[endif]-->Mayor needs to know that this is what the Governor wishes to discuss at the meeting January 7 along with financial resources that we still need some estimates on cost from DHHS for

<!--[if !supportLists]-->5) <!--[endif]-->Meegan and Dave need to noodle how best to get out front with this and change the narrative focus on Monday's Genesee County declaration of emergency

I know we are all working way too hard for what should be a rest and recharge period but I do appreciate everyone's efforts and I know the Boss really does as well.

Regards,

Rich

## A Proposal to Create the Flint Water Inter-Agency Coordinating Committee (FIACC)

In collaboration with the Flint After-Action Task Force, MSP Captain Chris Kelenske, DHHS Chief Deputy Tim Becker and DHHS Director Nick Lyon, Harvey Hollins and Rich Baird are recommending the immediate creation of the above referenced entity, with its sustained role and responsibility enabled under the Governor's Executive Order.

### Statement of Need

Due to a combination of resource constraints, inexperienced personnel, "silo" bureaucratic processes and reactionary approaches to immediate problems, there is a nearly complete lack of coordination, communication, and connected management amongst all the departments and stakeholders who must work together to ensure Flint's return to clean, safe water and to coordinate mid and long term efforts to mitigate and address future health and behavioral consequences from lead ingestion. This group **MUST** be stood up regardless of whether (or when) the conditions required for a declaration of emergency are met by the City, County, State or Federal authorizers. This coordinating body must include:

- The creation of a routine information process between all parties.
- Pursuit of other avenues of funding including federal grants and legislative appropriations.
- While the Emergency Management Act or the Stafford Disaster Relief and Emergency Assistance Act may be mechanisms to fix the issues in Flint, portions of the Emergency Management Act outlining management of events are applicable and should be implemented without delay (e.g. Local emergency operations plans/emergency operations guides as well as emergency operations support plans).

### Action Plan and Establishing the FIACCC

It appears that a request for a Governor's declaration may be from the county as soon as January 4, 2016. The state's Emergency Coordinator (Capt. Kelenske) will evaluate the request and provide a recommendation whether to issue a declaration, following established protocol and due diligence. But immediately, we will:

1. Establish an interagency workgroup Chaired and Vice-Chaired by Harvey Hollins and Chris Kelenske, respectively, and be comprised of DHHS, MDEQ, MSP, Treasury, Genesee County, City of Flint, MDE, LARA and external Subject Matter Experts (SMEs). Civil Rights may be added at a later time. If additional agencies/stakeholders who can assist with accomplishing the action plan are needed, they will be added. Personnel must be goal oriented, transparent with findings and measures of progress, and able to work toward accomplishing the Incident Action Plan created by the state in a timely manner. A draft Organization Chart is attached under separate cover.
2. This body should be created by Executive Order and it must complement and not replace the current system under the Emergency Management Act. In fact, it should demonstrate how to best leverage support where existing laws fall short under a man-made emergency.
3. Utilize the National Incident Management System and Unified/Incident Command as appropriate.
4. Establish routine communications protocols at the operational, executive, and legislative levels as determined appropriate.
5. Establish interagency workgroup objectives using the following as a starting point.

## Interagency Workgroup Objectives

1. Determine and convey acceptable standards for potable water.
  - Identify needed remediation.
  - Convey the remediation plan objectives to all stakeholders and interested parties.
  - Logistics plan for distribution and serving homebound citizens with water and filtration
  - Implement the plan.
2. Determine health impacts for the impacted population.
  - Identify treatment methods.
  - Nutrition education and support
  - Coping with lead exposure (care, monitoring, neurodevelopmental screening, access to DBP specialists, psychologists/psychiatrists, expanded county services, etc.)
  - Convey the treatment plan objectives to interested parties.
  - Implement the plan.
3. Establish a public information protocol to effectively inform the community of the situation and actions taken.
  - Identify existing Public Information outlets within the city, county, and state.
  - Establish a Joint Information Center
  - Provide for Emergency Alerts and Updates
  - Leverage public and private education schools
  - Determine official information flow and approval of information.
  - Convey to interested parties.
4. Assess the status of the infrastructure and determine feasible actions to upgrade the water system.
  - Determine current state of the infrastructure.
  - Develop priorities, costs, and potential funding sources for infrastructure upgrades as part of a long term recovery plan.
  - Seek partners to assist (NGOs, Foundations, Business, etc.)
  - Implement the plan.

## Final Thoughts

After the team provides input to this document, I would ask that Governor Snyder review and approve the approach, authorize Harvey Hollins to get the plan to Mayor Weaver no later than this weekend, and then proactively communicate the plan regardless of whether we get an Emergency declaration or not.

Also, we do believe setting up an Emergency Command Center which requires 24/7 staffing is sensible until AFTER Genesee County has demonstrated they did all they could and couldn't solve the problem. That is what is required under the law.

**CITY OF FLINT**  
**INCIDENT ACTION PLAN**  
**STATE OF EMERGENCY**

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA C. HENDERSON  
CITY ADMINISTRATOR

## **Objectives:**

To provide short term relief and long term solutions in addressing the man-made emergency of increased lead levels in the City of Flint (the "City") water system resulting from the switch to Flint River as the City's water source as well as the threat to public health related to elevated blood lead levels in Flint residents, without interruption of the provision of public safety and other essential public services. Due to the fluidic nature of emergencies and the complexity of the City of Flint's declared emergency, this plan serves as a framework and may be altered as the emergency develops.

## **The Response Framework**

The purpose of this plan is to organize efforts on behalf of the city to assess the extent of the City's infrastructure needs and risks to public health, provide immediate relief to those who are at risk, and establish long term solutions. In addition, the city must ascertain what immediate relief and long term solutions the City is capable of implementing based on what resources are available. For any activities that are beyond the resource capacity of the City, external sources of funding, supplies, and manpower must be sought.

There are a number of steps that must be taken in accordance with the Flint Emergency Support Operations Plan (SEOP), in order for the City to be compliant with the Genesee County Emergency Action Guidelines. These include the activation of the Incident Management Team, the Emergency Operation Center, and the sharing of essential documents with the County, including this plan. Information must also be shared by the City's Public Information Officer on a regular basis, as required by the SEOP.

This plan calls for the provision of immediate relief to those at risk in our community. Special consideration must be given to residents who belong to underserved groups, such as those who are homebound, undocumented, in poverty, etc. Additional consideration must also be given to the equitable provision of services throughout our community in order to equally protect the health and safety of every member of our community.

Implementation of this plan is to be conducted by the Incident Management Team, which will monitor the effective delivery of goods and services in order to address the conditions of the emergency.

## **Understanding the Issue:**

October 1, 2015, the Genesee County Health Department issued a Public Health Emergency after elevated blood-lead levels were found among children in the City of Flint. This incident correlates with elevated levels of lead found in the City's drinking water after the City switched water sources in April of

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA C. HENDERSON  
CITY ADMINISTRATOR

2014 to the Flint River. The scope of this problem appears to be limited to Flint City Water Customers and their dependents. Public agencies from several levels of government, as well as charitable, nonprofit organizations have partnered with the City to provide immediate relief to Flint residents, including the expansion of health services, the provision of bottled water and NSF rated water filters. The city is also seeking long term infrastructure improvements to eliminate lead and other contaminants from the water system.

Gov. Rick Snyder appointed a task force to review "actions regarding water use and testing in Flint" and to make recommendations for future guidelines: Members of the state task force are Ken Sikkema of Public Sector Consultants, Chris Kolb of the Michigan Environmental Council, Dr. Matthew Davis of the University of Michigan Health System, Eric Rothstein of the Galardi Rothstein Group and Dr. Lawrence Reynolds of Mott Children's Health Center.

In an effort to halt the further escalation of this crisis, the City returned to receiving its water from the Detroit Water and Sewerage Department (DWSD) on October 16, 2015. Since that time, additional corrosion control program has started, estimating a reduction of lead levels over the next six months. In light of these efforts, concerns surrounding the quality of water and health of the residents persist to the point that Mayor Karen Weaver declared a State of Emergency on December 14, 2015 so as to resolve this crisis once and for all.

The current challenge facing the City is providing immediate relief and long term solutions of the quality of the water and health of residents while the City remains in a financially critical condition. It is hoped and expected that higher levels of government recognize this emergency as it pertains to the condition of the City's infrastructure and health of its residents, and do all things necessary to assist the City in the provision of relief and the execution of capital improvement projects that will eliminate the causes of this emergency.

## Enhancing Understanding:

### Information Collection

Essential Elements of Information (EIs) can be qualified as the City's water tests containing lead results, the verification of lead water lines (both public and private), and health information. Water testing is performed by the City's water plant in cooperation with the MDEQ. The verification of lead water lines is being handled by University of Michigan Flint, who is currently digitizing the City's water line information and PSI Engineering, who is initiating the effort to verify lead lines by excavating an initial 150 residential lines. This information allows the Incident Management Team to assess the current condition of the emergency by way of determining the water quality and the condition of the water distribution infrastructure.

## **Information Analysis**

The City has sought partners to assist in the analysis and attenuation of complex data. Wayne State University's center for Urban Studies has agreed to assist the City in its efforts to document and track lead water lines, water test results, and filter distribution with geographic information system (GIS) technology. This allows for easily updateable, digestible information to be presented to officials.

## **Assessment of Impacts**

The City will need assistance in determining the total cost of damage done to the public health and infrastructure. As of now, only portions of this damage are visible.

PSI is providing some assistance by excavating 150 residential water lines to verify that they are comprised of lead. This is an initial step, but not enough. More resources will be needed to continue this process.

## **Continuous Situational Awareness**

It is important that the Emergency Management Team receive continuous information regarding water testing results, lead water line numbers, and filter distribution information in order to gain a realistic and current perspective. Much of this information is currently available on the City's website (cityofflint.com) and more is added each week by the PIO team.

## **Actions taken in Response to the Emergency**

### **Activation of the Incident Management Team**

Upon the declaration of Emergency by Mayor Weaver, the Support Emergency Operations Plan (SEOP) was activated. The SEOP calls upon the Incident Management Team to generate the Incident Action Plan (IAP). Each member of this team serves a specific function as it relates to addressing the causes and effects of the emergency. The Emergency Management Team roster can be found in the SEOP on page 3, with a list of alternates on page 4 in case the need for succession arises.

### **Emergency Operations Center**

The Emergency Operations Center (EOC) must be activated upon the declaration of a State of Emergency by the Mayor. This center is required by the SEOP and serves as a nerve center for the Incident Management Team. Here, emergency relief efforts are coordinated by key members of the Incident Management Team. In this case, these relief efforts consist of the distribution of water filters at

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA C. HENDERSON  
CITY ADMINISTRATOR

City Hall and community events, the distribution of bottled water throughout the city in conjunction with the efforts of community partners, and assisting with the circulation of water testing kits throughout the community. The EOC will also be monitoring and managing the inventory of relief supplies, such as water filters and bottled water.

According to the SEOP, the EOC must establish an incident tracking system. This system will serve as a work plan for the management of the emergency. In addition, it is essential that the IMT record water testing results, lead water line location information, and information about the distribution of water filters and bottled water all in one place so that information is readily available for the Incident Management Team. This information will also be sent out to the public and media in the form of daily regular updates by the City's PIO.

## Communication

The EOC maintains a telephone system that exists to intake questions about relief efforts and to organize relief logistics. It is open from 8am to 5pm, Monday through Friday. A voicemail system and eventual email system will exist to handle requests and inquiries that occur outside of the normal operating hours. This system will be constructed by the City's IS department.

## Public Awareness and Education

### 1. Emergency Alerts and Updates:

The City's Public Information Officer will make available information as it relates to the emergency in the form of press releases, emails, and physical documents. Daily updates containing information on the distribution of water filters, bottled water, water testing, blood lead testing, and other relief efforts will be available on the City's website for the public to view. Information will be available at City Hall for residents.

### 2. Joint Information Center:

The City's PIO will establish a joint Information Center that is organized to coordinate the efforts of multiple agencies to communicate with the public. This includes the circulation of joint press releases, public health information, educational materials, and updates relating to the State of Emergency. This committee is comprised of public information officers and public relations personnel to coordinate efforts to keep the public updated and informed. Regular updates to the media regarding events and progress will be made as news develops.

The US EPA has offered assistance in the form of Public Information support. Additional support in this area has been provided by the Michigan State Police.

### 3. Education:

Many government agencies and philanthropic organizations are already distributing information regarding the effects of lead on public health. It is important that the City assist in these efforts so vital information and knowledge is presented to all members of the community. The goal is to continue to eliminate misunderstandings and incorrect information as it relates to reducing lead in drinking water, pursuing medical help, and maintaining a healthy diet to reduce lead absorption in the body. Lead education is currently being performed by the Genesee County Health Department, the Michigan Department of Health and Human Services and Medical community at-large.

### Assessment of Social Needs

In order to effectively and equitably provide immediate relief to Flint water customers, the City must take into account many of the socio-economic needs and limitations of the community. Some residents cannot get to City Hall for a water filter. Some residents do not have internet access. Literacy or a language barrier may also pose significant obstacles to the effective distribution of educational information and relief to those in need. These will be continuing challenges facing the community. At present these are the resources the City has available to mitigate some of those challenges.

### Logistics

Logistics are being coordinated by the City Emergency Management Team's City's *Chief Logistics Officer*, who is the City Administrator. The CLO is responsible for the coordination, procurement, and transportation of goods and services, which is essential for effective implementation of the response plan.

### Fixed Distribution Points

There are several locations throughout the city where residents may acquire a water filter. These locations are:

***Flint City Hall***

*1101 South Saginaw, Flint MI 48502*

***Genesee County Community Action Resource Department (GCCARD)***

*601 North Saginaw, Flint MI 48502*

*and*

*2727 Lippencott Blvd, Flint MI 48507*

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA C. HENDERSON  
CITY ADMINISTRATOR

## **Michigan Department of Health and Human Services**

4809 Clio Road, Flint MI 48504

and

125 E. Union Street, Flint, MI 48502

### **Activation of Ward Distribution Centers**

Each of the nine wards will have activated distribution centers that are primarily managed by City Council Members or their designees.

#### **Flint City Council – Water Distribution Sites**

WARD	COUNCILPERSON	LOCATION	ADDRESS
1	Eric Mays	Hasselbring Senior Center	1002 W. Home Avenue
2	Jackie Poplar	Joy Tabernacle Church	2505 N. Chevrolet Avenue
3	Kerry Nelson	Antioch Baptist Church	1083 E. Stewart Avenue
4	Joshua Freeman	Flint Fire Station No. 5	3402 Western Road
5	Wantwaz Davis	Doyle/Ryder Elementary School	1040 N. Saginaw Street
6	Herbert Winfrey	New Community Baptist Church	1375 Lavender Avenue
7	Monica Galloway	Brennan Community Center	1301 Pingree Avenue
8	Vicki VanBuren	Flint Southwestern Academy	1420 W. 12 <sup>th</sup> Street
9	Scott Kincaid	Dort Mall Police Service Station	3600 S. Dort Highway

### **Mobile Distribution Centers**

With the help of transportation agencies, like the Metro Transit Authority (MTA), meals on wheels, and GCCARD, the city can help establish mobile distribution centers and delivery systems that can provide water filters, bottled water, and nutritious foods, among other types of relief accompanied by educational materials to neighborhoods and to homes of people who experience limited mobility.

- Mass Transportation Authority-MTA bus passes: Assisting residents with bus passes to improve their mobility will increase their chances of receiving help. Transportation services will also improve residents' access to medical care.
- MTA-Your Ride mobile distribution:
  - Estimated Costs: \$25 per hour to deliver water and filters to homes throughout the City.

### **Problem 1. Public Health Emergency**

The first objective in addressing this emergency is reducing, and eventually eliminating, the danger to public health. As City water coming out of faucets continue to contain lead, and copper and other

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA C. HENDERSON  
CITY ADMINISTRATOR

harmful contaminants exceeding government guidelines and regulations, it poses a risk to the people of our community. Preventative measures must be taken to avoid the effects of toxicosis that are difficult if not impossible to completely reverse.

As far as preventative measures are concerned, education, water filters, and bottled water must be provided to every household in the City in order to reduce the chances of lead exposure, especially to our most vulnerable members of the community. If lead exposure has occurred, resulting in elevated blood lead levels, immediate and sustained medical attention must be available to those affected. Health services must be expanded in the area to accommodate increased numbers of case loads and specialized care regarding lead poisoning and its effects.

## **Immediate Relief for Public Health:**

1. Prevention: Education, water filters and replacement cartridges, free water testing, and bottled water must be available to everyone.
2. Access to nutritious food that reduces the risks of lead absorption by the body. The City can coordinate activities with the County Health Department

## **Long Term Solutions: Maintaining Public Health and Coping with Lead Exposure**

1. Work closely with the Genesee County Health Department and Michigan Department of Health and Human Services in order to provide sustainable care and monitoring of children exposed to lead. This care must be available for them for several years-preferably several decades.
2. Support and education for primary care providers regarding aggressive long-term neurodevelopmental screening and testing.
3. Improved access to developmental and behavioral (DBP) specialists, pediatric psychologists, pediatric psychiatrists.
  - a. Pre-emptive referral to mental health/ toxic stress screenings.
  - b. Support capacity building and or incentivize recruitment to allow Genesee health system (CMH) to build this capacity which is currently needed and lacking.
4. Increase recognition and education regarding trauma informed care, social determinants of health (SDOH).
5. Expand State funded Genesee Health System (CMH) services.
  - a. Infant mental health (30 day capacity)
  - b. Child case management
  - c. Home based services
  - d. Trauma informed care- trauma focused CBT

## **Problem 2. Lead Contamination in the Water**

### **Immediate Relief:**

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA L. HENDERSON  
CITY ADMINISTRATOR

1. Education, water filters and replacement cartridges, free water testing for water customers, and bottled water must be available to everyone. Water filters can be obtained at any of the fixed distribution points throughout the City.
2. Identification and verification of lead water service lines throughout the city- both public and private.
3. Assistance to identify lead pipes within buildings and homes.

## **Distribution of Bottled Water:**

At this point, we are directing all offers for donations to the Food Bank of Eastern Michigan. It is imperative that water be accessible to all members of the community through a variety of distribution channels. These channels are explained in the Logistics Section of this plan.

## **Distribution of Test Bottles:**

Water testing kits can be picked up at City Hall with instructions. Test results are posted on the City's website to raise public awareness and encourage more participation.

## **Long term Solutions: Capital Improvements Needs**

The distribution of filters, water, and food to counter the effects of lead are essential response efforts to keep people safe. However, long term solutions are required to keep people healthy, to eliminate lead from the public and private water distribution system distribution, and to provide affordable clean water. Our public infrastructure and utilities must be reliable, sustainable, and equitable in order for this community to rebound after this emergency. The following long term solutions must be implemented in order to set the City of Flint on a course for recovery. These solutions come at a heavy cost for a City that is currently in receivership. The City has experienced financial distress due to this Emergency, in addition to a two million dollar loss from switching back to DWSD. The City has diligently applied for Fiscally Distressed Cities, Villages, and Townships, Grant in order to supplement funding for capital improvement projects. It is essential that these grants be awarded in order to achieve long term solutions.

### **1. COMPLETE Transition to a Temporary Safe Water Source until the Completion of KWA:**

This has already occurred. On October 16, 2015, Flint returned to receiving its water from DWSD on a 9 month agreement. This agreement will expire in June 2016, when the KWA is projected to be complete. The City had to pay \$2 million out of its general fund to make this switch.

### **2. IN PROGRESS Additional Corrosion Control added to the Water System:**

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA C. HENDERSON  
CITY ADMINISTRATOR

This is already occurring. In early December, 2015, Flint began to add additional corrosion control to the water coming in from DWSD in attempts to rebuild the protective scale inside its pipes. This is estimated to reduce lead levels in two to six months.

### 3. **Faucet Replacement:**

Replacement of Water faucets, and drinking fountains in the school system. It has been determined after state inspections that many sources of lead contamination in the School System's water were the faucets themselves. These faucets need to be replaced.

### 4. **Water Line Replacement:**

Water Line Replacement to reduce antiquated infrastructure and lead service lines. These lines must be identified, verified, and replaced. Residents who are facing financial hardships must have access to assistance to cover the costs of these replacements through access to grants and (forgivable) loans made available through State and Federal agencies. The corrosion damage to public and private lines that Flint River water caused is still being determined.

- Replacement of an estimated fifteen thousand (15,000) lead service lines at an estimated cost of three thousand dollars (\$3,000) per line. Total costs forty –five million dollars (\$45,000,000). This project is estimated to be one of the most cost-intensive endeavors related to ameliorating water contaminants.

### 5. **Reimbursement of Critical Expenditures:**

Seeking reimbursement of two million dollar cost of returning to DWSD and forgiveness of Water Revolving Loan Debt from the State of Michigan.

6. **KWA Capital Improvements:** The City has reconnected to Detroit temporarily until a water line from Port Huron is developed. The new water line known as the KWA pipeline or Karegnondi Water Authority is expected to bring water to the City from Lake Huron by July. The current cost agreement between Flint and DWSD is for nine months, therefore it is imperative that KWA be completed as soon as possible. Assistance relating to capital improvements to expedite this process will help to achieve long term goals.

#### **KWA Capital Improvements:**

#### **Estimated Costs:**

a. <i>Transfer Station to Dort Reservoir</i>	<i>\$4,500,000</i>
b. <i>Raw water line to pump station #4</i>	<i>\$636,000</i>
c. <i>Phosphoric acid feed system</i>	<i>\$186,000</i>
d. <i>Alum Feed system</i>	<i>\$40,000</i>
e. <i>Post filtration system</i>	<i>\$387,289</i>

# CITY OF FLINT

DR. KAREN WEAVER  
MAYOR

NATASHA C. HENDERSON  
CITY ADMINISTRATOR

f. SCADA Upgrades	\$424,000
g. Sewer Relining	\$100,000
<b>Total</b>	<b>\$6,273,289</b>

## Ancillary Considerations: Public Safety during an Emergency

During a time of emergency public safety agencies need to be prepared to respond to threats to public safety and critical infrastructure. The City is facing a man-made emergency that is threatening the public health. Resentment and hostility toward local institutions and municipal government is at a significant level.

Critical infrastructure should be safeguarded if the need arises. This includes increasing security at City Hall to reduce potential for public safety risks. In the case of credible threats to public infrastructure, it may be required to hire private security company for first line of defense. Private Security is lower cost, thereby making it the first option. The minimum response is acted upon first, elevating only if the need arises. Credible or imminent threats of damage or destruction to critical infrastructure requires an elevated response. Such needs may require over-time police officers to address critical situations. Mutual aid from surrounding communities can be requested if Flint public safety is overextended.

## Implementation:

### Community Partners

Financial limitations of the city persist while it confronts this emergency. Many community partners have offered their assistance to perform various needed functions. The city is heavily reliant on the assistance that government agencies and nonprofit organizations have provided.

#### The Mott Foundation

The Mott Foundation has provided financial assistance, especially in their generous contribution of \$4 million. In addition, the Mott Foundation has recently pledged an additional

#### United Way

The Genesee County United Way has provided significant financial assistance in the way of purchasing and helping to distribute water filters since the public health emergency began on October 1<sup>st</sup>, 2015.

#### Genesee County Community Action Resources Department (GCCARD)

GCCARD is organized to fight poverty and has been a primary partner in the distribution of water filters. It has also regularly supported the city with the logistics and availability of water filters at City Hall.

### **Genesee County Health Department**

Has provided educational information to Flint Water customers

### **Genesee County Board of Commissioners**

The Board of Commissioners have pledged their support to help Flint seek solutions to this crisis. The Board has already assisted in making health and nutrition information available to the public.

### **Assistance from Wayne State University**

Wayne State University's Center for Urban Studies will be providing technical GIS support to assist in the documentation of emergency relief efforts.

### **The US Environmental Protection Agency**

Region 5 EPA has offered assistance with Public Information distribution during the emergency.

### **Outside Help is still needed...**

The City of Flint is forever thankful to our community partners who have given so much to help so many people. However the magnitude of this emergency calls for more resources that are beyond the capacity of the combined local organizations and government agencies. Long term solutions will require a heavy investment in health care and capital improvement projects to upgrade the city's antiquated water distribution system.

- Help with Immediate Relief in terms of assuring allocative efficiency. Distribution should be equitable- assistance from other governments required to assure this.
- Reaching communities for the distribution of water filters, water, and educational materials.
- Help with Water Testing to increase participation and lead education.
- Increasing the rate of water testing
- Assistance is required to fund essential capital improvement projects to guarantee clean and safe water.

Subject: Numbered Letter L 15-73

Attached for your information is letter L 15-73, dated December 30, 2015.

L 15-73 – Blood Lead Guidelines to Address the City of Flint Residents' Potential Exposure to Lead.

This letter was sent to Practitioners, Clinics, Laboratories and Maternal Infant Health Program (MIHP) Providers in the City of Flint.

Medicaid Letters can be accessed on the web at [www.michigan.gov/medicaidproviders](http://www.michigan.gov/medicaidproviders) >> Communication and Training >> Click 2015 under Numbered Letters.

December 30, 2015

<Provider Name>  
<Provider Address1>  
<Provider Address2>  
<Provider City> <state> <zipcode5>-<zip4>

Dear Provider:

**RE: Blood Lead Guidelines to Address the City of Flint Residents' Potential Exposure to Lead**

Michigan Medicaid Early Periodic Screening, Diagnosis and Treatment (EPSDT) guidelines require children to be tested for blood lead poisoning at 12 and 24 months of age, and between 36 and 72 months of age if the child has not been previously tested as indicated by the Medicaid Provider Manual. The Manual is located at: [www.michigan.gov/medicaidproviders](http://www.michigan.gov/medicaidproviders) >> Policy and Forms.

Due to the enhanced public health issue of an increased risk for lead exposure in the City of Flint, providers have been advised to follow enhanced guidelines for lead testing in children:

- Providers should screen ALL children (regardless of Medicaid/insurance status) between 0 and 6 years of age that may have been exposed to the City of Flint drinking water after April 2014. Note: This includes all children less than 1 year of age and children between 3 and 6 years of age.
- If the child has already been screened since April 2014 by a capillary test, providers should follow-up on any elevated levels greater than 5 mcg/dl to ensure confirmatory venous testing is conducted.
- Providers should utilize the standard Blood Lead Level (BLL) Quick Reference for Primary Care Providers located at: [www.mi.gov/documents/deq/ProviderQuickReference\\_Sept2015\\_501831\\_7.pdf?20151204122739](http://www.mi.gov/documents/deq/ProviderQuickReference_Sept2015_501831_7.pdf?20151204122739).
- All clients with blood lead levels greater than 5 mcg/dl should be referred for case management coordinated through the Genesee County Health Department.
- Providers should inquire about the use of a drinking water filter and/or bottled water by all clients residing within the Flint city limits.
- Providers should inquire about other potential sources of lead within the household per the current recommendations of the Childhood Lead Poisoning Prevention Program's Statewide Lead Testing/Lead Screening Plan. The Statewide Lead Testing/Lead Screening Plan is located at: [www.michigan.gov/documents/mdch/testing-screening071009\\_287511\\_7.pdf](http://www.michigan.gov/documents/mdch/testing-screening071009_287511_7.pdf).

Lead testing performed using these enhanced testing guidelines is covered as a Medicaid EPSDT service. Providers should contact the beneficiary's Medicaid health plan for additional assistance if needed. Any questions regarding this letter should be directed to Provider Inquiry, Department of Health and Human Services, P.O. Box 30731, Lansing, Michigan 48909-8231, or e-mail at [ProviderSupport@michigan.gov](mailto:ProviderSupport@michigan.gov). When you submit an e-mail, be sure to include your name, affiliation, and phone number so you may be contacted if necessary. Providers may phone toll-free 1-800-292-2550.

Sincerely,

A handwritten signature in black ink, appearing to read "Chris Priest", with a stylized flourish extending from the end.

Chris Priest, Director  
Medical Services Administration

Team:

I have received all of the input provided and thank you. The following highlights:

<!--[if !supportLists]-->n <!--[endif]-->The only two "enterprise wide" folks we have as Coordinators are Harvey Hollins and Chris Kalenske. I have changed their titles to reflect a coordination/facilitation role and not connote "We are in charge and to hell with everyone else". Therefore I have changed the org chart and created a "dotted line" depiction—and also added the Legislative body as they (or subsets) may have a role here as well.

<!--[if !supportLists]-->n <!--[endif]-->But make no mistake, we are going to be accountable whether we should be or not so we are not syndicated the leadership that comes with the coordinating roles. I rewrote certain pieces of the proposal to reflect our inclusion, equality and partnership. But make no mistake, Harvey and Chris are the guys who will make this coordination effort work and if either of them encounter resistance with any of our partners in this effort, I have pledged to have their backs using my persuasive charm and bankruptcy tested mediation skills...

<!--[if !supportLists]-->n <!--[endif]-->I did not bring in more departments at this time. That is not to say they would not be value add, but there is a difference between an emergency response and planning effort, and introducing some other ways to get help and support to Flint. We will do that too, but not at this time.

<!--[if !supportLists]-->n <!--[endif]-->I have attached Tim Becker's Supplemental Request. Note that even at \$6 million over 2 years it does not include funding for the sort of long term monitoring of consequences of lead impact.

<!--[if !supportLists]-->n <!--[endif]-->Lastly I want people to know that we are committed to a spirit of inclusion, even with those who have been relentless in their attacks without offering any insights to solutionality. But some of these people have a stronger interest in advancing their own personal agenda and not devoting any real efforts to solving real problems. They will only be welcome if they decide to pursue the latter behavior vs. the former.

Unless someone thinks I really botched something up in the proposal, I would now ask Jarrod to give it final blessing and share with the Governor to get confirmation on the way forward.

Thanks everyone for a less than 24 hour turnaround and...

Go Green

Ok ok...Go Blue too...

HNY,

Rich

Sent from Mail for Windows 10

## A Proposal to Create the Flint Water Inter-Agency Coordinating Committee (FIACC)

In collaboration with the Flint After-Action Task Force, MSP Captain Chris Kelenske, DHHS Chief Deputy Tim Becker and DHHS Director Nick Lyon, Harvey Hollins and Rich Baird are recommending the immediate creation of the above referenced entity, with its sustained role and responsibility enabled under the Governor's Executive Order.

### Statement of Need

Due to a combination of resource constraints, inexperienced personnel, "silo" bureaucratic processes and the need to react to immediate problems, there is a lack of coordination, communication, and connected management amongst the departments and stakeholders who must work together to ensure Flint's return to clean, safe water and to coordinate mid and long term efforts to mitigate and address future health and behavioral consequences from lead ingestion. This group **MUST** be stood up regardless of whether (or when) the conditions required for a declaration of emergency are met by the City, County, State or Federal authorizers.

This inter agency group must fully engage with those we seek to serve. Equal partners. Equal leadership. Equal responsibility. Equal chance to be part of the solution to an important and not fully understood problem. We need our fellow citizens to be our partners in finding a solution, to feel they and their city and community leaders are not just part of the solution but are leading the solution with partners they can trust. This entity needs to be coordinated by State of Michigan leaders who represent statewide resources and constituencies and the citizens who comprise them. This coordinating body must include:

- The creation of a routine information process between all parties.
- Pursuit of other avenues of funding including federal grants and legislative appropriations.
- While the Emergency Management Act or the Stafford Disaster Relief and Emergency Assistance Act may be mechanisms to fix the issues in Flint, portions of the Emergency Management Act outlining management of events are applicable and should be implemented without delay (e.g. Local emergency operations plans/emergency operations guides as well as emergency operations support plans).

### Action Plan and Establishing the FIACC

It appears that a request for a Governor's declaration may be coming from Genesee County as quickly as January 4, 2016. The state's Emergency Coordinator (Capt. Kelenske) will evaluate the request and provide a recommendation whether to issue a declaration, following established protocol and due diligence. But immediately, we will:

1. Establish an interagency workgroup coordinated by Harvey Hollins and Chris Kelenske (who will be actively supported in their work by Rich Baird), and be comprised of DHHS, MDEQ, MSP, Treasury, Genesee County, City of Flint, MDE, LARA and external Subject Matter Experts (SMEs). Civil Rights and MSHDA may be added at a later time. If additional agencies/stakeholders who can assist with accomplishing the action plan are needed, they will be added. Personnel must be goal oriented, transparent with findings and measures of progress, and able to work toward accomplishing the Incident Action Plan created by the state in a timely manner. This is not a discussion or policy group.

It is an active problem solving, execution oriented group of professionals of equal stature completely dedicated to the Flint solution and remediation, and enabled by the statewide capabilities of the coordinators. Staff will be needed with competencies in disaster/emergency planning, operations, logistics and finance as outlined under the National Incident Management System (NIMS). These management components are accountable to the coordinating leadership to ensure tracking of resource requests, and incident action plan items are created, documented and completed. A draft Organization Chart is attached under separate cover and the “dotted lines” depict a non-hierarchical structure where the members commit to working, communicating and sharing collectively vs departmentally.

2. This body should be created by Executive Order and it must complement and not replace the current system under the Emergency Management Act. In fact, it should demonstrate how to best leverage support where existing laws fall short under a man-made emergency.
3. Utilize the National Incident Management System and Unified/Incident Command as appropriate.
4. Establish routine communications protocols at the operational, executive, and legislative levels as determined appropriate.
5. Establish interagency workgroup objectives using the following as a starting point.

#### Interagency Workgroup Objectives

1. Determine and convey acceptable standards for potable water.
  - Identify needed remediation.
  - Convey the remediation plan objectives to all stakeholders and interested parties.
  - Logistics plan for distribution and serving homebound citizens with water and filtration
  - Implement the plan.
2. Determine health impacts for the impacted population.
  - Identify treatment methods.
  - Nutrition education and support
  - Coping with lead exposure (care, monitoring, neurodevelopmental screening, access to DBP specialists, psychologists/psychiatrists, expanded county services, etc.)
  - Convey the treatment plan objectives to interested parties.
  - Implement the plan.
3. Establish a public information protocol to effectively inform the community of the situation and actions taken.
  - Identify existing Public Information outlets within the city, county, and state.
  - Establish a Joint Information Center
  - Provide for Emergency Alerts and Updates
  - Leverage public and private education schools
  - Determine official information flow and approval of information.
  - Convey to interested parties.
4. Assess the status of the infrastructure and determine feasible actions to upgrade the water system.
  - Determine current state of the infrastructure.

- Develop priorities, costs, and potential funding sources for infrastructure upgrades as part of a long term recovery plan.
- Seek partners to assist (NGOs, Foundations, Business, etc.)
- Implement the plan.

#### Next Steps

1. Input to this plan has been received and incorporated where feasible. Chief of Staff Jarrod Agen gives final draft approval and reviews with Governor Snyder as soon as possible but not later than Saturday, January 2, 2016
2. Governor Snyder reviews approves/adjusts and decides on the plan and authorizes Harvey Hollins to provide the plan to Mayor Karen Weaver on Saturday or Sunday, January 3, 2016.
3. As a courtesy, I would like to share the plan with the Flint WAATF after it has been provided to Mayor Weaver.
4. Communications should have a strategy on when this plan gets released publically (before, during or after the expected Emergency Declaration by Genesee County. If there is no declaration, we should proactively communicate (and perhaps share the communication with the TF).
5. We are not contemplating activating the State Emergency Operations Center (SEOC) until AFTER Genesee County has demonstrated they did all they conceivably could have done, utilized all available resources to include contracts and mutual aid, and couldn't solve the problem. That is what is required under the Emergency Management Act.
6. MDHHS has put forth a supplemental budget request for FY 16 and 17 for testing, outreach, education, etc. It does not contemplate behavioral or cognitive remediation in the event of lead poisoning.

6	
7	
8	
9	Support two epidemiologists to analyze blood lead levels based on zip codes in the City of Flint. Work conducted by the epidemiologists will be new functions not currently conducted. Positions will be supported through contracts with MPHIL. Costs reflect contractual and service costs to abate lead from homes in the City of Flint. Contractual funds will support 3.5 contractual staff - 2.5 field consultants to conduct abatement and one to assist with client application and form processing (total \$187,500). Funds for the service include the cost to abate 100 homes @ \$15,000 each (\$1.5 million) which will include internal housing plumbing components where necessary. Current efforts financed in the previous FY16 supplemental did not support lead abatement activities.
10	Additional contractual efforts to support lead investigations in 100 additional homes in the City of Flint. Service will be provided by ETC Consulting.
11	Funds support the increased testing and follow up necessary with the new homes being investigated. Nurse case managers provide follow up with families, provide nutrition counseling, and coordination with Environmental Blood Level (EBL) investigations.
12	Contractual FTEs will work with the Genesee County Health Department (GCHD) to build educational efforts in that community to develop a more detailed education plan.
13	One contractual peer educator FTE at Genesee County Health Department to help increase WIC enrollment and retention to assist with lead testing, nutrition education, and overall health of pregnant moms and infants.
14	
15	
16	
17	
18	
19	Continue the funds from the original FY16 supplemental for existing nurse case management of EBL home investigations.
20	Continue the funds from the FY16 request above and support two epidemiologists to analyze blood lead levels and will address broader areas beyond the City of Flint. Work conducted by the epidemiologists will be new functions not currently conducted.
21	Continue the funds from the FY16 request above and finance contractual and service costs to abate lead from homes in the City of Flint. Contractual funds will support 4 contractual staff - 3 field consultants to conduct abatement and one to assist with client application and form processing (total \$311,000). Funds for the service include the cost to abate an increase to 130 homes @ \$15,000 each (\$1.95 million) which will include internal housing plumbing components where necessary. Current efforts financed in the previous FY16 supplemental did not support lead abatement activities.

Subject: Draft Documents Subject to Attorney Client Privilege (FIAAC)

Team:

I have received all of the input provided and thank you. The following highlights:

<!--[if !supportLists]-->n <!--[endif]-->The only two "enterprise wide" folks we have as Coordinators are Harvey Hollins and Chris Kalenske. I have changed their titles to reflect a coordination/facilitation role and not connote "We are in charge and to hell with everyone else". Therefore I have changed the org chart and created a "dotted line" depiction—and also added the Legislative body as they (or subsets) may have a role here as well.

<!--[if !supportLists]-->n <!--[endif]-->But make no mistake, we are going to be accountable whether we should be or not so we are not syndicated the leadership that comes with the coordinating roles. I rewrote certain pieces of the proposal to reflect our inclusion, equality and partnership. But make no mistake, Harvey and Chris are the guys who will make this coordination effort work and if either of them encounter resistance with any of our partners in this effort, I have pledged to have their backs using my persuasive charm and bankruptcy tested mediation skills...

<!--[if !supportLists]-->n <!--[endif]-->I did not bring in more departments at this time. That is not to say they would not be value add, but there is a difference between an emergency response and planning effort, and introducing some other ways to get help and support to Flint. We will do that too, but not at this time.

<!--[if !supportLists]-->n <!--[endif]-->I have attached Tim Becker's Supplemental Request. Note that even at \$6 million over 2 years it does not include funding for the sort of long term monitoring of consequences of lead impact.

<!--[if !supportLists]-->n <!--[endif]-->Lastly I want people to know that we are committed to a spirit of inclusion, even with those who have been relentless in their attacks without offering any insights to solutionality. But some of these people have a stronger interest in advancing their own personal agenda and not devoting any real efforts to solving real problems. They will only be welcome if they decide to pursue the latter behavior vs. the former.

Unless someone thinks I really botched something up in the proposal, I would now ask Jarrod to give it final blessing and share with the Governor to get confirmation on the way forward.

Thanks everyone for a less than 24 hour turnaround and...

Go Green

Ok ok...Go Blue too...

HNY,

Rich

## A Proposal to Create the Flint Water Inter-Agency Coordinating Committee (FIACC)

In collaboration with the Flint After-Action Task Force, MSP Captain Chris Kelenske, DHHS Chief Deputy Tim Becker and DHHS Director Nick Lyon, Harvey Hollins and Rich Baird are recommending the immediate creation of the above referenced entity, with its sustained role and responsibility enabled under the Governor's Executive Order.

### Statement of Need

Due to a combination of resource constraints, inexperienced personnel, "silo" bureaucratic processes and the need to react to immediate problems, there is a lack of coordination, communication, and connected management amongst the departments and stakeholders who must work together to ensure Flint's return to clean, safe water and to coordinate mid and long term efforts to mitigate and address future health and behavioral consequences from lead ingestion. This group **MUST** be stood up regardless of whether (or when) the conditions required for a declaration of emergency are met by the City, County, State or Federal authorizers.

This inter agency group must fully engage with those we seek to serve. Equal partners. Equal leadership. Equal responsibility. Equal chance to be part of the solution to an important and not fully understood problem. We need our fellow citizens to be our partners in finding a solution, to feel they and their city and community leaders are not just part of the solution but are leading the solution with partners they can trust. This entity needs to be coordinated by State of Michigan leaders who represent statewide resources and constituencies and the citizens who comprise them. This coordinating body must include:

- The creation of a routine information process between all parties.
- Pursuit of other avenues of funding including federal grants and legislative appropriations.
- While the Emergency Management Act or the Stafford Disaster Relief and Emergency Assistance Act may be mechanisms to fix the issues in Flint, portions of the Emergency Management Act outlining management of events are applicable and should be implemented without delay (e.g. Local emergency operations plans/emergency operations guides as well as emergency operations support plans).

### Action Plan and Establishing the FIACC

It appears that a request for a Governor's declaration may be coming from Genesee County as quickly as January 4, 2016. The state's Emergency Coordinator (Capt. Kelenske) will evaluate the request and provide a recommendation whether to issue a declaration, following established protocol and due diligence. But immediately, we will:

1. Establish an interagency workgroup coordinated by Harvey Hollins and Chris Kelenske (who will be actively supported in their work by Rich Baird), and be comprised of DHHS, MDEQ, MSP, Treasury, Genesee County, City of Flint, MDE, LARA and external Subject Matter Experts (SMEs). Civil Rights and MSHDA may be added at a later time. If additional agencies/stakeholders who can assist with accomplishing the action plan are needed, they will be added. Personnel must be goal oriented, transparent with findings and measures of progress, and able to work toward accomplishing the Incident Action Plan created by the state in a timely manner. This is not a discussion or policy group.

It is an active problem solving, execution oriented group of professionals of equal stature completely dedicated to the Flint solution and remediation, and enabled by the statewide capabilities of the coordinators. Staff will be needed with competencies in disaster/emergency planning, operations, logistics and finance as outlined under the National Incident Management System (NIMS). These management components are accountable to the coordinating leadership to ensure tracking of resource requests, and incident action plan items are created, documented and completed. A draft Organization Chart is attached under separate cover and the “dotted lines” depict a non-hierarchical structure where the members commit to working, communicating and sharing collectively vs departmentally.

2. This body should be created by Executive Order and it must complement and not replace the current system under the Emergency Management Act. In fact, it should demonstrate how to best leverage support where existing laws fall short under a man-made emergency.
3. Utilize the National Incident Management System and Unified/Incident Command as appropriate.
4. Establish routine communications protocols at the operational, executive, and legislative levels as determined appropriate.
5. Establish interagency workgroup objectives using the following as a starting point.

#### Interagency Workgroup Objectives

1. Determine and convey acceptable standards for potable water.
  - Identify needed remediation.
  - Convey the remediation plan objectives to all stakeholders and interested parties.
  - Logistics plan for distribution and serving homebound citizens with water and filtration
  - Implement the plan.
2. Determine health impacts for the impacted population.
  - Identify treatment methods.
  - Nutrition education and support
  - Coping with lead exposure (care, monitoring, neurodevelopmental screening, access to DBP specialists, psychologists/psychiatrists, expanded county services, etc.)
  - Convey the treatment plan objectives to interested parties.
  - Implement the plan.
3. Establish a public information protocol to effectively inform the community of the situation and actions taken.
  - Identify existing Public Information outlets within the city, county, and state.
  - Establish a Joint Information Center
  - Provide for Emergency Alerts and Updates
  - Leverage public and private education schools
  - Determine official information flow and approval of information.
  - Convey to interested parties.
4. Assess the status of the infrastructure and determine feasible actions to upgrade the water system.
  - Determine current state of the infrastructure.

- Develop priorities, costs, and potential funding sources for infrastructure upgrades as part of a long term recovery plan.
- Seek partners to assist (NGOs, Foundations, Business, etc.)
- Implement the plan.

#### Next Steps

1. Input to this plan has been received and incorporated where feasible. Chief of Staff Jarrod Agen gives final draft approval and reviews with Governor Snyder as soon as possible but not later than Saturday, January 2, 2016
2. Governor Snyder reviews approves/adjusts and decides on the plan and authorizes Harvey Hollins to provide the plan to Mayor Karen Weaver on Saturday or Sunday, January 3, 2016.
3. As a courtesy, I would like to share the plan with the Flint WAATF after it has been provided to Mayor Weaver.
4. Communications should have a strategy on when this plan gets released publically (before, during or after the expected Emergency Declaration by Genesee County. If there is no declaration, we should proactively communicate (and perhaps share the communication with the TF).
5. We are not contemplating activating the State Emergency Operations Center (SEOC) until AFTER Genesee County has demonstrated they did all they conceivably could have done, utilized all available resources to include contracts and mutual aid, and couldn't solve the problem. That is what is required under the Emergency Management Act.
6. MDHHS has put forth a supplemental budget request for FY 16 and 17 for testing, outreach, education, etc. It does not contemplate behavioral or cognitive remediation in the event of lead poisoning.

**Subject:** Privileged Attorney-Client Communication - Outline of Flint Drinking Water Issues

Ken – Attached is the outline of the Flint Drinking Water issue (in a question and answer format) we have prepared for you to share with your colleagues on the Governor's Flint Water Task Force. Please let me know if we can provide any other material in preparation for the meeting tomorrow.

**City of Flint Drinking Water  
Outline prepared by the  
Michigan Department of Environmental Quality for the  
Flint Water Task Force**

**I. INTRODUCTION**

This document is intended to provide an overview of Michigan's implementation of the Safe Drinking Water Act, 1976 PA 399, as amended (Act 399), with respect to events in the city of Flint (City), Michigan.

**II. BACKGROUND**

**1. How has Flint historically obtained its drinking water?**

The water system in the City was organized and built under private ownership in 1883 as the Flint Water Works Company to pump raw water from the Flint River to their consumers. In 1903, the system was converted to a municipally-owned corporation which supplied drinking water to the City. In 1967, the City became a customer of the Detroit Water and Sewerage Department (DWSD) system.

After the switch to DWSD, the City operated its water treatment plant as a standby plant for purposes of reliability in the event of an emergency, such as an interruption in service of the single pipeline from DWSD. In the last ten years, the water treatment plant was used as an emergency backup during two weeks in 2009: June 18 through June 20 and September 10 through September 13.

As a backup emergency water treatment plant, the City was required to operate the water treatment plant quarterly to demonstrate the capability to produce drinking water in accordance with Act 399 and to keep mechanical equipment (such as valves, rubber seals, etc.) in good working order. Each quarter, the water treatment plant was test run and samples were taken of both raw water and finished water (post-filters). Since the water treatment plant was upgraded in the early 2000s, monitoring showed that the water treatment plant was performing as designed.

Contractual obligations with DWSD did not allow treated water to be put into the City's distribution system during these test runs. Treated water was discharged to the Flint River in accordance with a National Pollutant Discharge Elimination System (NPDES) Permit. The test runs were for demonstration purposes, to keep the water treatment plant operational, and staff familiar with operation in the event it was needed in an emergency.

**2. What State and Federal laws or rules exist to ensure safe drinking water is provided to City residents?**

The federal Safe Drinking Water Act (federal SDWA) is the primary law that ensures the quality of Americans' drinking water. Under the federal SDWA, the United States Environmental Protection Agency (USEPA) sets standards for drinking water quality and oversees the states, localities, and water suppliers who implement those standards.

The federal SDWA was originally passed by Congress in 1974 to protect public health by regulating the nation's public drinking water supply. The law was amended in 1986 and 1996 and requires many actions to protect drinking water and its sources: rivers, lakes, reservoirs, springs, and ground water wells. (The federal SDWA does not regulate private wells which serve fewer than 25 individuals.)

Originally, the federal SDWA focused primarily on treatment as the means of providing safe drinking water at the tap. The 1996 amendments greatly enhanced the existing law by recognizing source water protection, operator training, funding for water system improvements, and public information as important components of safe drinking water. This approach ensures the quality of drinking water by protecting it from source to tap.

The most direct oversight of water systems is conducted by state drinking water programs. States can apply to the USEPA for "primacy," - the authority to implement the federal SDWA within their jurisdictions - if they will adopt standards at least as stringent as the USEPA's and enforce those standards. Michigan adopted the Safe Drinking Water Act in 1976 through Act 399 and has maintained primacy for the program since that time.

### **3. What is the USEPA's role as a regulatory agency in implementing the SDWA?**

Federal and state governments share responsibility for administering drinking water programs. Under the federal SDWA, the USEPA is given the responsibility for developing national standards and regulations that apply to the nation's public drinking water systems and enforcing those standards, by working with states.

Michigan's drinking water program is evaluated annually by the USEPA for compliance with the federal SDWA. Based upon these evaluations, the USEPA continues to find Michigan's drinking water program to be compliant with the federal SDWA.

### **4. What is the Michigan Department of Environmental Quality's (DEQ) role as a regulatory agency in implementing the SDWA?**

The federal SDWA permits states to accept oversight of the drinking water program under an agreement with the USEPA giving states primary enforcement responsibilities (or primacy). In addition to this delegation of federal authority to the states, states also have the power to create additional regulations and programs governing drinking water suppliers through their own legislative and regulatory processes. Michigan has had regulatory authority of public water supplies since 1913 (Waterworks and Sewerage Systems, 1913 PA 98).

The DEQ has been granted primary enforcement authority in Michigan for the federal SDWA under the authority of Act 399. As such, the DEQ, Office of Drinking Water and Municipal Assistance, has regulatory oversight for all public water supplies, including approximately 1,400 community water supplies and 10,000 noncommunity water supplies. A community water supply provides year-round service to 15 or more living units (homes, apartments, dorm rooms, etc.) or 25 or more residents. A noncommunity water supply has 15 or more service connections or serves 25 or more individuals on an average daily basis for not less than 60 days per year.

The DEQ engages in a variety of activities to help water systems remain in, or return to, compliance. These activities include: conducting surveillance visits (inspections) at water systems and reviewing facilities, equipment, and operations; requiring the submission of plans and specifications for waterworks system improvements and issuing construction permits; providing for the training, examination, certification and regulation of persons operating water supplies; helping systems incorporate preventive measures; and since 1996, providing financial assistance for system improvements.

**5. What is the City's role in implementing the federal SDWA and Act 399?**

State and federal programs develop regulations and perform oversight and compliance activities, but do not treat or deliver water to customers. At the local level, public and private water utilities collect, treat, and deliver drinking water to consumers in compliance with state and federal regulations.

The federal SDWA and Act 399 set up multiple barriers against contamination. These barriers include: source water protection, multiple treatment components, distribution system integrity, proper operations oversight, and public information. As the owner of a public water system, the City is responsible for knowing and following all requirements under Act 399, such as ensuring proper design, construction, operations and maintenance, so that contaminants in tap water do not exceed the standards established by law. The City treats the water, and must test its water routinely for specified contaminants and report the results to the DEQ. If a water system is not meeting these standards, it is the water supplier's responsibility to notify its customers.

The federal SDWA and Act 399 recognize that customers have the right to know what is in their drinking water and where it comes from. The City, like all water suppliers, must notify consumers when there is a problem with water quality.

The City submits samples of its water for laboratory testing (monitoring) to verify the water it provides to residents meets all federal and state standards. How often and where samples are taken varies from system to system and from contaminant to contaminant. The DEQ provides an annual monitoring schedule to the City setting forth these requirements.

In addition, the City is required to employ properly certified water operators that are trained and experienced to operate the treatment and distribution systems associated with the City's water system.

**6. What approvals were needed from the DEQ in order for the City to begin using its water treatment plant full time?**

The City had long ago been issued construction permits for raw water pumps to withdraw water from the Flint River and the City was grandfathered under the water withdrawal program (Part 327, Great Lakes Preservation, of the Natural Resources and Environmental Protection Act, 1994 PA 451, as amended), as were all existing community public water systems at that time. There were no additional DEQ

permissions or authorizations required under Act 399 because the City already had approval to use the water treatment plant.

Under Act 399, there are no licenses or permits required to operate public water systems. The City did apply for and obtained two construction permits prior to the water treatment plant changing from an emergency backup plant to full-time operation. These permits were for new chemical feed equipment, changes to the electrical service, etc.

### **III. THE FLINT RIVER – IS IT A SAFE SOURCE OF DRINKING WATER?**

Seventy-five percent of Michigan's population served by a public water supply receive their drinking water from surface water sources, the majority of which is withdrawn from the Great Lakes. However, several public water supplies in Michigan utilize water from inland rivers. All surface water sources require significant treatment in order to be safe for consumption.

While all surface water sources must receive a high level of treatment, inland river sources present a greater challenge than water withdrawn from one of the Great Lakes because of rapidly changing water quality conditions. Under most circumstances, rivers are prone to greater fluctuations in temperature, have higher amounts of organic material, greater turbidity (suspended solids), and are more vulnerable to microbiological and viral contamination than Lakes Huron, Erie, Michigan or Superior. While the water chemistry in the Flint River differs from that in Lake Huron, it can still be treated in accordance with the federal SDWA and Act 399. The waterworks industry has the technology to treat wide ranging source waters to provide potable and palatable drinking water, including direct reuse of treated wastewater. Regardless of source water quality, all public water systems must comply with the same drinking water standards in the finished water.

It is not the source water that reacts with the homeowners plumbing in the distribution system, but rather the finished water quality that is important. Treated water leaving the City's water treatment plant does not contain lead. In addition, the treatment process employed by the City includes lime softening to reduce the hardness in the river water. The City includes lime softening and pH adjustment primarily to improve aesthetic water quality associated with hardness. Lime softening is not a process that water supply professionals would expect to increase corrosivity of water. The City, however, does practice recarbonation to readjust pH at the end of the softening process.

pH levels of finished water leaving the City's water treatment plant averaged 7.7. Expanded water monitoring conducted quarterly at 25 sample sites located throughout the distribution system showed the following:

July – September 2014	average pH = 7.71	range: 7.56 – 7.86
October – December 2014	average pH = 7.88	range: 7.62 – 8.10
January – March 2015	average pH = 7.81	range: 7.60 – 7.99
April – June 2015	average pH = 7.63	range: 7.48 – 7.80

The data below was obtained at ten of the sampling locations throughout the City's distribution system, while they were still purchasing water from DWSD before the City switched to the Flint River as a source:

January – March 2014 (DWSD)	average pH = 7.47	range: 7.40 – 7.54
April 2014 (DWSD)	average pH = 7.49	range: 7.42 – 7.59

Note that the pH of the treated water produced while the City was using the Flint River did not differ significantly from pH values seen in the distribution system during the time the City purchased water from DWSD. Thus, pH monitoring provided no indication of a change in water corrosivity.

#### **IV. *E. COLI* AND TOTAL COLIFORM BACTERIA VIOLATIONS**

##### **1. What caused the *E. coli* and total coliform bacteria violations experienced by the City in August and September 2014?**

A number of factors, primarily related to distribution system operation and maintenance, likely contributed to the Boil Water Advisories in the City during August and September 2014 triggered by exceedances of bacteria standards in limited areas of the distribution system. In addition, the coliform detections were confined to less than 20 percent of the water system. Had the detections been the result of a failure in treatment, detections would have been expected throughout the City rather than in such a limited geographic area.

Instead, the violations seem to have been caused by other factors such as aging infrastructure. The City's water distribution system has suffered from a lack of infrastructure investment and asset management. Most of the City's over 550 miles of water mains are now over 75 years old, and constructed of unlined cast iron piping. This cast iron pipe is subject to tuberculation, which thins and weakens the pipe walls in some areas and causes a buildup of sediment and debris on the pipe walls in other areas. Tuberculation can lead to water quality issues as well as reduced flows and pressures. Tuberculation also encourages the development of biofilms. Biofilm growth may occur more frequently in areas where little or no disinfectant is maintained.

The City has also experienced decades of a declining customer base and water use, with vacant homes, commercial businesses, and industrial property. Declining water use leads to excess residence time (water age) within the City's distribution pipes and water storage facilities, accelerating tuberculation, biofilm growth, and reductions of disinfectant concentration in the distribution system. While the City has recently seen an infusion of funding for blight removal, contractors using fire hydrants to complete this work have been known to cause hydraulic disturbances that dislodge and suspend settled debris, which may contribute to the bacterial contamination. These hydraulic disturbances were also believed to be a source of the aesthetic water quality complaints both the City and the DEQ were receiving.

The winter of 2013-2014 was also one of the coldest experienced by the water system. The City, which historically has unaccounted water losses of over 30 percent, saw even greater losses since February 2014 due to an increase in cold weather-related water main breaks and leaks (City personnel reported 400 water

main breaks in calendar year 2014, with greater than 50 percent in the winter quarter). The City has also been lacking a formal maintenance program for its more than 7,250 valves, which are critical in limiting the areas impacted during water main repairs. As an example, two valves on the transmission line used to supply the area of the 2014 Boil Water Advisories were found to be closed during the City's investigation of possible sources, causing much longer residence times, reduced disinfectant concentrations, and reduced pressures – all potential avenues for contamination to enter a distribution system.

The Boil Water Advisories also occurred during the warmest and relatively wet periods of August and September 2014. Warm weather conditions are not only more conducive to bacterial growth but also degrade disinfectant concentrations more quickly. As already explained, longer residence times, biofilms, and tuberculation contribute to lowered disinfectant concentrations. Warm, wet weather conditions also allow water contaminated with bacteria to accumulate or pond around piping that leaks and breaks.

During the summer of 2014, the City was actively repairing the distribution system (City personnel reported 29 water main breaks in June through August 2014). After the switch to the Flint River, it was discovered that there were many broken or closed valves in the distribution system (City personnel reported 120 broken valves and 239 valves in an improper position). As the City began correcting these problems, they did detect the presence of coliform organisms in the distribution system in testing conducted as a result of the repairs. This sporadic detection is not an unusual occurrence. Many communities have experienced similar issues when significant repairs are made in the system and/or they suffer water main breaks and localized pressure losses.

## **2. How were the violations detected? What was the DEQ's response?**

Federal SDWA regulations regarding monitoring and standards for bacteria in water distribution systems are incorporated into Act 399. There are a variety of bacteria, parasites, and viruses which can potentially cause health problems if humans ingest them in drinking water. Testing water for each of these potential pathogens would be difficult and expensive. Instead, community water systems are required to test monthly for total coliform and *E. coli*. Total coliform bacteria, while not pathogenic, often originate from the same sources as many pathogens. Therefore, the presence of total coliform in drinking water indicates there may be a pathway for pathogens or other contaminants to enter the system. The absence of total coliforms in the distribution system indicates a minimal likelihood that pathogens are present. *E. coli* is itself a pathogen and its detection is considered direct evidence of a health risk.

The Boil Water Advisories which occurred in the City were associated with bacteria monitoring detections and violations of bacteria standards. These advisories were issued by the City after consultation with the DEQ.

Upon receiving information indicating total coliform and *E. coli* bacteria had been detected, the DEQ advised the City to issue a Boil Water Advisory from August 15 through 20, 2014, for the affected portion of the City. Another Boil Water Advisory was issued from September 5 through 9, 2014, due to localized detections of total

coliform bacteria in the same and adjacent portions of the City. The advisories covered an area of less than 20 percent of the water department's service area.

Once a Boil Water Advisory has been issued, time is needed to investigate potential causes and implement corrective measures. The larger the water system, the more time this may take. Once corrective measures have been taken, samples must be collected and analyzed to confirm that bacteria are no longer present. Under approved analytical methods used by the City, samples must be incubated for 24 hours before results can be obtained. In situations where the bacterial contamination has been confirmed, two consecutive rounds of safe samples collected at least 24 hours apart are normally obtained before canceling a Boil Water Advisory. Adding each of these steps together, a normal response period to rescind a Boil Water Advisory under these circumstances would be expected to take 3 to 4 days.

## **V. TOTAL TRIHALOMETHANES (TTHM) VIOLATIONS**

### **1. What caused the TTHM violations experienced by the City beginning in late summer 2014?**

Disinfectants are an essential element of drinking water treatment because of the barrier they provide against waterborne disease-causing microorganisms. However, disinfection byproducts form when disinfectants used to treat drinking water react with naturally occurring organic materials in the water (e.g., decomposing plant material). The formation of disinfection byproducts continues to occur as water travels throughout water distribution systems.

A major challenge for water suppliers is how to provide protection from pathogens while simultaneously minimizing health risks to the population from disinfection byproducts. Total Trihalomethanes (TTHM – chloroform, bromoform, bromodichloromethane, and dibromochloromethane) and halogenated acetic acids (HAA5 – monochloro-, dichloro-, trichloro-, monobromo-, dibromo-) are widely occurring classes of disinfection byproducts. The amount of TTHM and HAA5 in drinking water can change depending on the season, water temperature, amount of chlorine added, the amount of plant material in the water, and a variety of other factors. All community water systems that chemically disinfect or purchase water that has been chemically disinfected are required to monitor for disinfection byproducts.

The Flint River has higher levels of organic material than water in the Great Lakes and as a result, the water produced by the City developed higher disinfection byproducts than the water purchased from DWSD. Because the water treatment plant was previously operating intermittently, it was not possible to predict disinfection byproduct levels at distribution system compliance points until the City began relying on its water treatment plant continuously.

As mentioned previously, the City became aware that there were numerous broken valves and closed valves that should have been open in the distribution system. At that time, the City also began a mapping effort to identify "water age" in the distribution system. The longer the residence time or "water age" the greater the opportunity for the formation of disinfection byproducts.

**2. How were the violations detected? What was the DEQ's response?**

Disinfection byproducts are monitored at eight sites throughout the distribution system. A locational running annual average is calculated for each individual site. Because TTHM and HAA5 maximum contaminant levels are calculated based on a running annual average at specific distribution system locations, the actual violation of the standard did not occur until the fall of 2014. However, because it was apparent in the summer of 2014 that the standard would eventually be exceeded; the DEQ asked the City to proactively implement measures to address the problem before the violation required them to do so.

As a result of maintenance efforts undertaken by the City to repair valves and correct improperly closed valves, the City was able to improve water flow in the distribution system and thereby reduce residence time or "water age" in the system. Operational changes made to reduce the amount of storage in the system also helped reduce residence time which contributed to a reduction in disinfection byproduct formation.

In addition to operational changes to minimize residence time in the distribution system, the City added granular activated carbon to its filters in July 2015. Levels of TTHMs and HAA5s were reduced and the City returned to compliance on September 1, 2015.

**VI. THE TASTE, ODOR, AND COLOR COMPLAINTS RECEIVED BY FLINT****1. What caused the taste, odor, and color complaints received by the City from residents?**

Taste, odor, and color issues are very personalized. While water leaving the water treatment plant did not have any unusual taste, odor or color; during the summer after the switch to the Flint River, customer complaints increased. Construction in the distribution system, hydrant flushing, and changes in flow characteristics are all known causes of disturbances within the distribution system that can cause an increase in taste, odor, and color complaints. Aesthetics, such as taste, odor, and color, while a concern, by themselves are not a threat to public health.

**2. What was the DEQ's response?**

The DEQ consulted with the City regarding these complaints. The City indicated that they were offering to investigate such complaints for anyone that had issues; but City personnel informed the DEQ that they were not able to recreate these situations in the field. In addition, as a result of the repair work that was underway and the increased flushing to reduce water age in the system to help control TTHMs, it was anticipated that there would be short-term disturbances in the system that would cause color and odor complaints. All water supplies are advised to provide notice to residents prior to undertaking a flushing program because flushing (even routine flushing) often causes temporary problems as described. Based on information from City personnel, it appeared that the complaints were related to such operational activities occurring in the distribution system.

## **VII. LEAD ISSUES IN THE FLINT DRINKING WATER**

### **1. What causes lead in drinking water?**

Lead is rarely found in source water. Lead enters tap water through corrosion of plumbing materials. Homes built before 1986 are more likely to have lead fixtures and solder. Older homes built prior to World War II are more likely to contain lead pipes. The most common problem with newer construction is with brass or chrome-plated brass faucets and fixtures which can leach significant amounts of lead into the water, especially hot water. The amount of lead in tap water also depends on the types and amounts of minerals in the water, how long the water stays in the pipes, the amount of wear in the pipes, the pH of the water, and its temperature.

### **2. What is the Lead and Copper Rule?**

On June 7, 1991, the USEPA published a regulation to control lead and copper in drinking water. This regulation is known as the Lead and Copper Rule (also referred to as the LCR). The treatment technique for the rule requires systems to monitor drinking water at customer taps. If the 90th percentile for lead exceeds an action level of 15 parts per billion (ppb) or the 90th percentile for copper exceeds an action level of 1.3 parts per million (ppm), the system must undertake a number of additional actions to control corrosion. If the action level for lead is exceeded, the water supply must also inform the public about steps they should take to protect their health and the water supply may have to replace lead service lines under their control.

### **3. What is the lead action level?**

For most contaminants, the USEPA sets an enforceable regulation called a maximum contaminant level based on the maximum contaminant level goal. Maximum contaminant levels are set as close to the maximum contaminant level goals as possible, considering cost, benefits, and the ability of public water systems to detect and remove contaminants at the water treatment plant using suitable treatment technologies. Because lead contamination of drinking water often results from corrosion of the plumbing materials belonging to water system customers, the USEPA established a treatment technique rather than a maximum contaminant level for lead. A treatment technique is an enforceable procedure or level of technological performance which water systems must follow to control a contaminant. Although the maximum contaminant level goal for lead is zero, based upon the above factors, the USEPA has established the action level for lead at 15 ppb.

The treatment technique regulation for lead requires water systems that produce drinking water to control the corrosivity of the water. The regulation also requires systems to collect customer tap samples from sites served by the system that are more likely to have plumbing materials containing lead. If the 90th percentile action level for lead is exceeded, then water systems are required to take additional actions including:

- Optimizing corrosion control treatment (for water systems serving greater than 50,000 people that have not fully optimized corrosion control).

- Educating the public about lead in drinking water and actions consumers can take to reduce their exposure to lead.
- Replacing the portions of lead service lines (lines that connect distribution mains to customers) under the water system's control.

**4. Did DWSD have optimized corrosion control treatment?**

After the LCR passed in 1991, DWSD and all of its consecutive customer systems conducted two rounds of monitoring for lead and copper. Copper levels were well below action level limits, but lead levels exceeded the action level of 15 ppb for DWSD and many of its customer communities. As a result, DWSD installed corrosion control treatment. DWSD performed a corrosion control study and concluded that they could reduce the corrosivity of the water by the addition of an orthophosphate, a corrosion inhibitor.

**5. Did the DEQ require the City to have corrosion control in place when it switched to the Flint River as its source of drinking water?**

No. There are two ways under the LCR to deem a water supply as providing "optimal corrosion control" – either by sampling and determining through a calculation that the supply is "optimal" or by installing treatment if it is needed. The DEQ requested that the City perform two 6-month rounds of monitoring to demonstrate if the City was practicing optimal corrosion control treatment. According to state regulations [R325.10604f(2)(b)(iii)], a system can demonstrate optimized corrosion controls by sampling in two, consecutive 6-month monitoring periods and comparing the results of this monitoring to the lead level in the source. Optimal corrosion control under this scenario would be defined as having the 90th percentile in each of these monitoring periods lower than the sum of the lead in the source and the practical quantification limit for lead of 5 ppb. Since the source water has 0 ppb lead, the City would have been deemed optimal if its 90th percentile of lead was 5 ppb or less in these two consecutive periods. However, once a system has installed treatment, it would also be considered optimized regardless of the 90th percentile level achieved, as long as it does not exceed the action level of 15 ppb.

In this case, the City had been purchasing water from DWSD that was treated for corrosion control. It was the DWSD water system that was considered as having optimized corrosion control at that point. Since the City water system had not been the supplier of water before, the DEQ did not require the City to maintain corrosion control for which it was not responsible [R325.10604f(2)(b)]. It could not "maintain" operations undertaken elsewhere by a different entity for a different source of water. The DEQ's instructions to the City were consistent with past practices afforded to all other large water systems. At the beginning of the LCR, all large systems were initially granted the option to demonstrate optimal corrosion control treatment through full-scale monitoring under the applicable rules. For these reasons, two 6-month rounds of monitoring, as required by the LCR, were the required means to determine whether or not optimal corrosion control was being achieved.

**6. How does the DEQ calculate the 90th percentile?**

To determine the 90th percentile of a list of lead or copper results, the procedure below is followed:

- Step 1: Place lead or copper results in ascending order  
 Step 2: Assign each sample a number, 1 for lowest value  
 Step 3: Multiply the total number of samples by 0.9 – this yields the 90th percentile sample. For example: 20 samples x 0.9 = 18th sample. This is the 90th percentile level.

Calculating the 90th percentile is easiest when a supply collects 10 samples (or a multiple of 10). Note that the 90th percentile must be interpolated if the number of samples is not a multiple of 10.

**7. What was the result of the first round of monitoring conducted by the City?**

The first 6-month round of lead and copper monitoring conducted by the City ended on December 31, 2014. One hundred samples were submitted and the 90th percentile lead level was calculated to be 6 ppb. The next step required by the DEQ was for the City to collect a second round of monitoring.

**8. What was the result of the second round of monitoring conducted by the City?**

The second 6-month round of lead and copper monitoring conducted by the City ended on June 30, 2015. Sixty-nine samples that complied with the site selection criteria were submitted and the 90th percentile lead level was calculated to be 11 ppb. The conclusion from these results was that the City, while in compliance with the action level, exceeded the level required to be deemed as having optimized corrosion control.

**9. Why was the City required to collect 100 compliance samples for lead and copper in the first 6-month monitoring period of July through December of 2014 and then only 60 compliance samples in the second 6-month period of January through June of 2015?**

The number of compliance samples required for lead and copper is based upon the population served by the water system as identified in the table below, taken from Rule 325.10710a of Act 399.

Supply Size (Number of People Served)	Number of Sites (Standard Monitoring)	Number of Sites (Reduced Monitoring)
More than 100,000	100	50
10,001 to 100,000	60	30
3,301 to 10,000	40	20
501 to 3,300	20	10
101 to 500	10	5
Fewer than 101	5	5

The number of samples the City was required to collect in the first round of monitoring after they began relying on the Flint River was based on the 2010 census, which listed the City's population as more than 100,000 residents. In March of 2015, the City provided updated information that indicated the City's population had decreased to less than 100,000. Therefore, they were only required to collect 60 samples. There is no rule prohibiting the collection of additional compliance samples – only establishing a minimum number necessary.

**10. What actions did the DEQ order the City to undertake after the second round of monitoring?**

While the City's LCR compliance monitoring continued to meet action level requirements, the City exceeded the level required to be deemed as having optimized corrosion control. Following receipt of the City's compliance monitoring results, the DEQ sent a letter on August 17, 2015, requiring the City to install corrosion control treatment.

Under the LCR, the City has 6 months to let the DEQ know whether it intends to conduct a study, then 18 months to perform the study and make its recommendation, and 24 months to complete installation of the selected corrosion control. The DEQ requested the City accelerate this schedule. The City submitted plans and specifications to install corrosion control treatment and a construction permit was issued by the DEQ on October 28, 2015. The City is in the process of installing the necessary equipment and procuring the appropriate chemicals. Treatment is expected to be on-line by the end of November 2015. As of October 16, 2015, the City resumed purchasing water from DWSD that is already optimized and provides a corrosion inhibitor. The additional treatment by the City will further enhance the amount of inhibitor in the system.

**11. What had Michigan Department of Health and Human Services (DHHS) advised the DEQ regarding blood lead levels prior to the DEQ ordering the City to implement optimized corrosion control?**

In an e-mail dated July 28, 2015, regarding blood lead testing, the Michigan DHHS indicated that they:

"...compared lead testing rates and lead testing results to the same time frame for the previous 3 years, to see if there were any patterns that suggested that there were increased rates of lead poisoning after the water supply was switched. Per the attached charts –

- Lead testing rates remained about the same from year-to-year...

- There was a spike in elevated blood lead tests from July-September 2014...

- However, that pattern was not terribly different from what we saw in the previous three years; especially in 2011-2012 (we are working with our Epidemiologist to statistically verify any significant differences).
- We commonly see a 'seasonal effect' with lead, related to people opening and closing windows more often in the summer, which disturbs old deteriorating paint on the windows, sills and sashes. Window fans frequently blow and spread the lead dust from the deteriorating paint to other parts of the room/house. We suspected that the summer data spike may be related to this effect.
- If the home water supply lines and/or river water were contributing to elevated blood lead tests, we expected that the increased rates would extend beyond the summer, but they drop quite a bit from September to October, stayed low over the winter, and are just starting to tail up again in the spring of 2015."

This e-mail from DHHS in concert with the completion of two 6-month rounds of lead compliance sampling data indicating that the City had not exceeded an action level for lead provided the basis for the DEQ to maintain that the water in the City continued to be in compliance with the federal SDWA and Act 399.

**12. When did the DEQ first become aware of allegations of elevated blood levels being detected in certain children?**

The DEQ was notified on August 23, 2015, by a professor from Virginia Tech that "over the next few months we will be studying Flint water quality issues..." Results indicating elevated lead levels in homes were reported as part of this study in late August. In September 2015, information was reported in news articles that

pediatricians in the City had data suggesting an increase in children's blood lead levels in two zip codes in the Flint area.

Prior to these dates, the City had already completed the required two 6-month rounds of monitoring and the DEQ had made a determination that the City must install corrosion control treatment as documented in correspondence dated August 17, 2015.

#### **VIII. QUESTIONS RAISED REGARDING THE DEQ'S ACTIONS**

**1. What was the DEQ's response to the USEPA's inquiry in February 2015 regarding the optimized corrosion control treatment being implemented by the City under the LCR?**

The DEQ indicated that the City was complying with the LCR, the lead 90th percentile level was below the action level of 15 ppb, and the City was already conducting the second round of monitoring which would provide for a determination of whether additional treatment needed to be installed. It should be noted that once treatment is designated as optimal, there is no requirement in the LCR that lead results be lower than they were before treatment was installed. The 90th percentile only needs to be lower than the action level in the LCR.

**2. Did the DEQ attempt to mislead the USEPA in a February 27, 2015, e-mail responding to the USEPA's inquiry regarding Optimal Corrosion Control Treatment?**

No. There was no attempt by the DEQ to mislead the USEPA. There is an e-mail from Steve Busch, Jackson and Lansing District Supervisor, Office of Drinking Water and Municipal Assistance, indicating that the City was practicing a corrosion control program. What was meant was that the City was performing the required monitoring to determine whether or not they were practicing optimized corrosion control. The DEQ subsequently clarified its position in follow-up e-mails and telephone conversations with the USEPA.

**3. When General Motors announced its intent to terminate water service from the City and purchase water from Genesee County, should this have been a sign that there were concerns with the quality of the water after the switch to the Flint River?**

No. General Motors made a decision regarding the quality of water for its manufacturing processes. At the time, the company indicated that the chloride levels were above limits acceptable as part of the manufacturing facility's limit for production purposes. The level of chlorides in the water treated by the City was not a human health or aesthetic concern.

Chloride does have a secondary maximum contaminant level established by the USEPA, not for health-related concerns but rather for taste and aesthetic concerns. Concentrations greater than the secondary maximum contaminant level of 250 milligrams per liter (mg/l) become objectionable due to taste. According to the City's records, the chloride concentration in the Flint River water is generally about 45 mg/l and the treated water chloride concentration leaving the water treatment

plant ranges between 55 and 65 mg/l. It should be noted that the City uses ferric chloride as its primary coagulant, although this does not add a significant amount of chloride to the finished water.

**4. Has the USEPA subsequently admitted that the LCR is subject to differing interpretations such as that presented by the DEQ?**

Yes. On November 3, 2015, the USEPA issued a memorandum regarding the "Lead and Copper Rule Requirements for Optimal Corrosion Control Treatment for Large Drinking Water Systems". This memorandum addresses concerns raised about the application of the LCR, specifically the requirements pertaining to maintenance of optimal corrosion control treatment, in situations in which a large water system ceases to purchase treated water and switches to a new drinking water source. The USEPA states that this type of situation rarely arises, that the language of the LCR does not specifically discuss such circumstances, and that there are differing possible interpretations of the LCR with respect to how the rule's optimal corrosion control treatment procedures apply to this situation. The memorandum is intended to clarify, on a prospective basis, steps agencies should take or apply in the future. USEPA's new guidance provides acknowledgement that the LCR is subject to differing interpretations. The DEQ's interpretation and application of the LCR in this situation was in compliance with the federal SDWA and Act 399.

**5. Did the DEQ reject any of the samples submitted by the City?**

Yes, samples at two locations were excluded from the compliance calculation in conformance with rules issued by the USEPA.

According to the LCR, compliance samples must be a first draw, 1-liter sample collected from a cold water, kitchen or bathroom tap after the tap has stood unused for not less than 6 hours. Federal and state rules require community public water systems to identify a pool of targeted high-risk sampling sites, called Tier 1 sampling sites. For a municipality such as the City, the Tier 1 sampling pool must consist of single family structures that are:

- served by a lead service line,
- contain lead pipes, or
- contain copper pipes soldered with lead installed after 1982 but before Michigan enacted the ban on solder containing high concentrations of lead (June, 1988).

As long as a community has Tier 1 sites that contain lead service lines, they are required to collect at least 50 percent of their compliance samples from these lead service line sites. Finally, federal and state rules specify that "Sampling sites may not include faucets that have point of use or point of entry treatment devices designed to remove inorganic contaminants." Such treatment devices include home softeners, iron filters, etc. Samples collected from multiple family residences, commercial buildings, institutional facilities, or single family structures with point-of-use or point-of-entry treatment can only be used if the community has insufficient Tier 1 sites available.

One of the samples submitted by the City was excluded from the 90th percentile compliance calculation in the latest monitoring period because it was taken from a tap at a non-residential site (non-Tier 1). The other sample result that was excluded was collected from a single family home that has a whole house treatment system. Both of these sites are, therefore, excluded from the compliance consideration based upon federal and state rules.

**6. Did the DEQ review the information submitted by the City to ensure all samples were from Tier 1 sites?**

Yes. The DEQ examined the information submitted and certified by the City that its LCR compliance monitoring sites consisted entirely of Tier 1 criteria sites, which met the requirements of this rule to maximize sampling of high-risk targeted sites.

During the initial implementation of the LCR approximately 25 years ago, water supplies were required to complete a materials evaluation of their distribution system to identify a pool of targeted, high-risk sampling sites. These sites were to be categorized into one of three Tiers (1, 2, or 3) based on risk. The DEQ created an LCR reporting template for water systems to identify each compliance sampling site by Tier, service line material, and building plumbing material.

If a water system has sufficient Tier 1 sites, they are required to sample them before using any lower Tier sites. Furthermore, if they have sufficient sampling sites with lead service lines, they are required to use them to make up at least 50 percent of their sampling pool each monitoring period. Water supplies are also required to use the same sampling sites each time or explain on their LCR reporting form why they were unable to do so. Finally, the water system is required to certify all of the information they provide on the LCR reporting form is factual.

The DEQ must rely upon the public water system to identify appropriate sampling sites for LCR monitoring. The DEQ public water supply program has no control or authority over service lines or domestic plumbing. As a result, we have no records on construction standards or materials used by customers for these components. If these records exist, they are kept by plumbing code enforcement officials.

In 2015, City employees again certified that the information submitted on their LCR monitoring reports for the two 6-month rounds of monitoring conducted after they began treating the Flint River were accurate, and DEQ staff review of that information indicated it was in compliance with the monitoring requirements. The DEQ had no reason to question the validity of the City's reports until the DEQ heard City employees revealing to the media that the City did not know for certain if its compliance monitoring was collected from homes with lead service lines. As a result, the DEQ began to investigate the City's monitoring sites. As the City began to transfer its customer information to electronic records, the DEQ determined from the information available that a significant number of these sites that had been listed as having lead service lines either did not have them or the information was unavailable. On November 9, 2015, the DEQ notified the City in writing that it would be necessary to conduct a complete assessment of its sampling pool and report back its findings by December 30, 2015. The DEQ is now awaiting the City's response.

**7. Did the DEQ believe the levels of lead found at 212 Browning in April 2015 were indicative of a system-wide problem?**

High levels of lead were collected in samples taken from this residence. It was determined to be coming from an unusually long lead service line. For some reason, this home was not connected to the water main that ran in front of the house, but rather to a main located on a street several houses away. The City replaced the lead service line May 6, 2015. Since the internal plumbing of the house is plastic, it was believed that replacement of the lead service line would resolve the problem, and subsequent sampling taken at this address showed that replacement of the service line did mitigate the problem. There was, therefore, no reason to believe that this was indicative of a system-wide problem.

**8. Do the DEQ's sampling instructions comply with the LCR?**

The DEQ continues to seek official clarification from the USEPA regarding the sampling protocols. The DEQ's sampling recommendations were developed to ensure compliance with the USEPA's guidance provided in the preamble to their lead and copper regulations that said that household use should be "typical" for a residential customer on the day before sample collection for lead and copper. Early in the implementation of the LCR, the DEQ had encountered too many situations where compliance samples had been collected from kitchen and bathroom taps that had not been used in days and in some cases, even weeks, resulting in excessively stagnated water and correspondingly high lead levels that did not represent typical exposure expected after overnight stagnation. To incorporate these results into further regulatory decision making could have led to actions that were not indicative of a true public health threat. Further complicating this issue was the USEPA's direct implementation of the LCR in Washington, D.C., where it was learned that some "valid" lead results were not always being included in compliance calculations. Subsequently, the USEPA made invalidation of samples for any reason much more difficult. In order to ensure samples were taken at customer taps representative of typical use, the DEQ devised the current recommendations for ensuring appropriate but not excessive stagnation for LCR monitoring.

The DEQ continues to believe it is appropriate to ensure that taps being sampled are representative of typical household use and are sampled during the recommended stagnation period of 6-18 hours. The LCR does not say the result should represent the "absolute worst case" condition – it talks about sampling the highest risk locations (lead plumbing, lead service lines, high lead content solder piping, etc.) after overnight stagnation and then collecting a first draw sample so as not to flush elevated lead from that tap at that point in time. There are a number of other states that share the DEQ's interpretation of the rule and the DEQ encourages the USEPA to provide official clarification directed at all states with primacy.

**9. Does the DEQ require the use of small-neck bottles to obtain samples?**

No. The DEQ does not mandate the use of small-neck bottles; it is the sampling method that is specified in both the federal SDWA and Act 399. Each certified drinking water laboratory provides bottles to their customers upon request for any particular analysis in accordance with the specifications in the SDWA. The bottles provided by the DEQ Drinking Water Laboratory for a lead and copper corrosion control sample meet these requirements.

**Sent:** Thursday, December 03, 2015 10:54 AM  
**To:** Baird, Richard (GOV);Clement, Elizabeth (GOV)  
**Subject:** FW: Flint Lead information  
**Attachments:** Flint Lead MDHHS Sitrep 11\_30\_15.docx; Flint Lead MDHHS Sitrep 12 1\_15.docx

FYI. These are the regular reports I am now receiving.

**Michigan Department of Health and Human Services Environmental Health**

**Flint Water Lead Project**

**MDHHS Situation Report**

**\*\*NOTE: Contains potentially Identifiable Information- REDACT AS INDICATED\*\***

**New items for the day listed first and in bold print.**

**Daily Briefing and Situation Report**

**Date:** November 30, 2015

**Surveillance Indicators:** People Tested since 10/1/2015: 1,361;

- Children less than 6 years old  $\geq 5 \mu\text{g}/\text{dl}$  since 10/1/2015: 15
- Children 6 to 17 years old  $\geq 5 \mu\text{g}/\text{dl}$  since 10/1/2015: 6
- Adults 18 years and older  $\geq 5 \mu\text{g}/\text{dl}$  since 10/1/2015: 9

**Severity Indicators:** Hospitalized/Discharged-1/1; Deaths- 0

**DAILY ACTIVITY SUMMARY**

**Elevated Blood Level (EBL) Environmental Investigations** – Wes Priem, Courtney Wisinski

- **Contractor (ETC) has 8 investigations scheduled.**
- **The high EBL home is scheduled for Friday 12/4/15.**
- DEH-Finalized residential tap water sampling protocol used to evaluate lead concentrations in households
- Contractor (ETC) has completed 1 EBL investigation, but will have to return for water sampling.

**MDHHS/Genesee County Health Department (GCHD) Case Management (CM) Services**

- No additional updates for 11/30/15
- Week Ending 11/20/15:
  - Number of contacts attempted: 58
  - Contacted and offered case management: 13
- DEH staff developing case management and EBL investigation database
  - compiles blood test results, case management services, and environmental sampling data for each Flint child with elevated blood lead level

**Epidemiology/Surveillance** – Patti McKane, Martha Stanbury

- **Completed re-evaluation of blood lead testing data from 1/1/2010 to current per the request of the Governor's office. Counts for 10/10/2015 will vary slightly from previously reported because of the change in de-duplication procedures to accommodate yearly counts.**
- **Draft Blood Lead Data report completed and conveyed to Eden Wells, Corinne Miller and Angela Minicuci.**

- Some problems were experienced in accessing all the laboratory electronic data files going back to last week's submissions over the holiday. Most were resolved with help from DTMB, and the rest should be resolved tomorrow morning. As a result, no daily report was created of newly reported individuals with BLL>20files but we will have this tomorrow.
- 1 child hospitalized [PHI] <2 yo, identified by lab who contacted primary provider with elevated blood lead level of 52 mcg/dl; hospitalized at Children's [PHI] follow-up tests decreased without need for chelation- discharged to home [PHI]
  - GCHD follow-up [PHI] and [PHI] case management and investigation in process- possible history of lead paint ingestion
  - Child with history of [PHI]
  - Other children in household tested, also followed by PCP.

### **Communications/Information Sharing**

- MDHHS/GCHD weekly call Nov 24 3PM- reviewed progress on case management and EBL testing
- Technical Advisory Committee meeting originally scheduled for December 9<sup>th</sup> , then postponed by City of Flint, may actually take place: awaiting word from City.

### **Health Education Resources Updates** - Kory Groetsch (stand-in for Michelle Bruneau)

- Bathing-specific fact sheet under development.
- DEH has drafted a phosphate fact sheet, reviewing/revising with DEQ Drinking Water Staff
- DEH working with CLPPP and GCHD to revise parent resources package to reduce reading level.

### **Toxicology** - Kory Groetsch, Jennifer Gray

- Developing Access database to track services provided to EBL children. Meeting held with other DEH staff to begin design.

### **WIC**

- No additional updates for 11/30/15
- Letter sent 11/24 to GCHD about Ready-to-feed formula availability from WIC program
- Talking points for WIC staff and for providers shared

### **Healthcare/Providers**

- No additional updates for 11/30/15
- Forum for primary care providers in Flint by public health being planned- 2<sup>nd</sup> – 3<sup>rd</sup> week December
- WIC information to be shared by GCHD to providers

### **DEQ Information** - Linda Dykema as Liaison

- **MDEQ would like to issue school drinking water testing results in coordination with MDHHS release of the blood lead test reporting.**

**Flint Water Lead Project**  
**Michigan Department of Health and Human Services**  
**Situation Report for December 1, 2015**

**\*\*NOTE: Contains potentially Identifiable Information- REDACT AS INDICATED\*\***  
**New items for the day listed first and in bold print.**

**Daily Briefing and Situation Report** prepared by Linda Dykema

**Surveillance Indicators:** People Tested since 10/1/2015: 1,361;

Children less than 6 years old  $\geq 5$   $\mu\text{g}/\text{dl}$  since 10/1/2015: 15

Children 6 to 17 years old  $\geq 5$   $\mu\text{g}/\text{dl}$  since 10/1/2015: 6

Adults 18 years and older  $\geq 5$   $\mu\text{g}/\text{dl}$  since 10/1/2015: 9

**Severity Indicators:** Hospitalized/Discharged-1/1; Deaths- 0

**DAILY ACTIVITY SUMMARY**

**Elevated Blood Level (EBL) Environmental Investigations** – ETC Contractors, Wes Priem, Courtney Wisinski

- **2 EBL investigations completed.**
- 8 investigations scheduled.
- The high EBL home is scheduled for Friday 12/4/15.

**MDHHS/Genesee County Health Department (GCHD) Case Management (CM) Services** – Nancy Peeler

- **CM report through 11/25/15:**
  - **# of contacts attempted: 136**
  - **# offered CM: 46**
  - **# CM started: 5**
  - **# of children receiving CM who live in Flint: 5**
  - **# billed to Medicaid: 5**
  - **# Other disposition: 2 (2 children moved to Oakland County)**
- **Held call with GCHD staff to clarify and resolve questions about the CM budget. The revised budget will be submitted in eGrams on or about 12/7/15.**
- **Held weekly status call with CM staff at GCHD:**
  - **Need to include developmental screening as part of the CM protocol, and need to share screening results with Early On when a referral is made;**

**Epidemiology/Surveillance** – Patti McKane, Martha Stanbury, Bob Scott, Jessica Cooper

- Completed re-evaluation of blood lead testing data from 1/1/2010 to current per the request of the Governor's office.
- Revised Draft Blood Lead Data report completed.

- 1 child hospitalized [PHI] <2 years old, identified by lab who contacted primary provider with elevated blood lead level of 52 µg/dl; hospitalized at Children's [PHI]; follow-up tests decreased without need for chelation- discharged to home [PHI].
  - GCHD follow-up [PHI] case management and investigation in process- possible history of lead paint ingestion
  - Child with history of [PHI]
  - Other children in household tested, also followed by PCP.

#### **Communications/Information Sharing** – Linda Dykema, Eden Wells

- **Weekly (Tues. 8:00 am) coordination call with DEQ/LARA/HHS. Discussed need for informational materials for schools/residents regarding lead free plumbing replacements.**
- MDHHS/GCHD weekly call Nov 24 3PM- reviewed progress on case management and EBL testing
- Technical Advisory Committee meeting originally scheduled for December 9<sup>th</sup> - , then postponed by City of Flint, may actually take place: awaiting word from City.

#### **Health Education Resources Updates** - Michelle Bruneau, Emily Houk

- **Revising Phosphate fact sheet. Will discuss with DEQ Drinking Water staff on 12/2/15**
- Bathing-specific fact sheet under development.
- DEH working with CLPPP and GCHD to revise parent resources package to reduce reading level.
- Working with Healthy Homes Section staff to revise EBL report for Flint Residents.

#### **Toxicology** - Kory Groetsch, Jennifer Gray, Lisa Quiggle

- **Working with GCHD and DEQ to address questions concerning impact of phosphate treatment on drinking water filters.**
- **Working with Healthy Homes Section staff to revise EBL report for Flint Residents.**

#### **WIC**

- No additional updates for 12/1/15
- Letter sent 11/24 to GCHD about Ready-to-feed formula availability from WIC program
- Talking points for WIC staff and for providers shared

#### **Healthcare/Providers**

- **Forum for primary care providers in Flint POSTPONED pending coordination with local providers**
- WIC information to be shared by GCHD to providers

#### **DEQ Information** - Linda Dykema as Liaison

- MDEQ would like to issue school drinking water testing results in coordination with MDHHS release of the blood lead test reporting.

**To:** Lyon, Nick (DHHS) <[LyonN2@michigan.gov](mailto:LyonN2@michigan.gov)>; Becker, Timothy (DHHS) <[beckert1@michigan.gov](mailto:beckert1@michigan.gov)>; Lasher, Geralyn (DHHS) <[lasherg@michigan.gov](mailto:lasherg@michigan.gov)>  
**Cc:** Grijalva, Nancy (DHHS) <[GrijalvaN@michigan.gov](mailto:GrijalvaN@michigan.gov)>; Wells, Eden (DHHS) <[WellsE3@michigan.gov](mailto:WellsE3@michigan.gov)>; Dykema, Linda D. (DHHS) <[DykemaL@michigan.gov](mailto:DykemaL@michigan.gov)>  
**Subject:** Call with Matt Davis

We had a great call with Matt, overall seemed very supportive of our recent efforts and intends to modify the letter to the Governor based on actions taken by MDHHS.

Highlights from our discussion:

- VERY PLEASED with today's release of information regarding lead testing
- Matt supportive of our ICS-like structure (with project managed by Division of Environmental Health) – very much in line with centralized coordination and communication
- Agrees with our proposal to use Medicaid population denominator as proxy for measuring progress in accelerating lead testing efforts
- VERY pleased with the efforts to partner with, engage Medicaid Health Plans in the public health response
- Had some suggestions for using MCIR as a tool to link children and their school districts to determine potential lead exposure
- Agrees there is lack of consensus among community providers about testing infants, but Eden/Sue/Matt agree that there must be a risk assessment for lead exposure from water, infants are at highest risk for adverse effects.

Please let me know if you have questions.

**#flintwatercrisis**

**HURLEY  
CHILDREN'S  
HOSPITAL**

# Background & Secondary Prevention

Mona Hanna-Attisha MD MPH FAAP  
Hurley Children's Hospital  
Michigan State University College of Human Medicine

# Agenda

- Flint Water Timeline
- Lead Facts
- Hurley Research Findings
- Introduction to Toxic Stress
- Next steps – Secondary Prevention

# Flint Drinking Water Crisis

- Financial Emergency Managers
- Water switch to Flint River (April 2014)
- Fecal coliform and boil advisories \*3 (Sept 2014)
- GM stopped using Flint water – corroding parts (Oct 2014)
- Disinfectant byproducts TTHM (Jan 2015-Sept 2015)

# Flint Drinking Water Crisis

- Perfect storm for lead leaching
  - Flint water more corrosive
  - Lack of corrosion control
  - Aging infrastructure (lead plumbing)
  - Decreased water use - population loss, high water rates

# Flint Drinking Water Crisis

HURLEY  
CHILDREN'S  
HOSPITAL

- High lead levels detected, EPA contacted (February 2015)
- Leaked EPA memo (June 2015)
  - LeeAnn Walters WLL 13,200 ppb (toxic waste)
- Dr Marc Edwards, Virginia Tech Research (Aug 2015)
  - Flintwaterstudy.org
  - Corrosion & water lead
- Hurley Research (Sept 2015)

# Why do we care about lead?

- Lead is a potent neurotoxin with lifelong, multigenerational impacts
- Blood lead levels (BLL) 5 ug/dL or more considered elevated blood lead levels (EBLL)
- Just a few years ago (2012), 10 ug/dL was cutoff
- NO safe blood lead level
- Disproportionately impacts low income and minority children
- Primary prevention is most important

# Primary Prevention

- “Because no measurable level of blood lead is known to be without deleterious effects, and because once engendered, the effects appear to be irreversible in the absence of any other interventions, public health, environmental and housing policies should encourage PREVENTION of all exposure to lead.”

“Low Level Lead Exposure Harms Children: A Renewed Call for Primary Prevention.” 2012 CDC Advisory Committee on Childhood Lead Poisoning Prevention.

# Impact on cognition

- ♦ Vast evidence supports increased likelihood of:
  - ♦ Decrease in IQ
    - ♦ An increase in BLL from 1 to 4 ug/dL, drops mean IQ -3.7 points
  - ♦ Small change in mean IQ, shifts entire population IQ distribution
    - ♦ Reduces high achievers IQs (>130) and increases kids with low IQs (<70)
    - ♦ Implications for early intervention, special education services, employment, incarceration, life achievement, etc

Lanphear BP et al., Low-level environmental lead exposure and children's intellectual function: an international pooled analysis. Environ Health Perspect, 2005. 113:894-9.

Fewtrell LJ, Pruss-Ustun A, Landrigan P, and Ayuso-Mateos JL, Estimating the global burden of disease of mild mental retardation and cardiovascular diseases from environmental lead exposure. Environmental Research, 2004. 94:120-33.

# Impact on behavior

- Increased likelihood of :
  - ADHD behaviors
  - Delinquent behaviors and arrests
  - Total arrests and increased rates of arrests involving violent offenses
- Other health effects: hematologic, cardiovascular, immunologic, endocrine, etc

Wright, JP, KN Dietrich, MD Ris, et al. 2008. Association of prenatal and childhood blood lead concentrations with criminal arrests in early adulthood. *PLoS Med* 5(5): e101

Chen, A, B Cai, KN Dietrich, et al. 2007. Lead exposure, IQ, and behavior in urban 5-7 year-olds: Does lead affect behavior only by lowering IQ? *Pediatrics* 119(3): e650-e658.

Needleman, HL, C McFarland, RB Ness, et al. 2002. Bone lead levels in adjudicated delinquents: A case control study. *Neurotoxicology and Teratology* 24(6):711-717.

# Cost

- “For childhood lead poisoning, \$5.9 billion in medical care costs, as well as an additional **\$50.9 billion** (sensitivity analysis: \$44.8–\$60.6 billion) per year in lost economic productivity resulting from reduced cognitive potential from preventable childhood lead exposure.”
- “The present value of Michigan’s economic losses attributable to lead exposure in the 2009 cohort of 5 year-olds ranges from \$3.19 (using U.S. blood lead levels) to **\$4.85 billion** (using Michigan blood lead levels) per year in loss of future lifetime earnings.”

Leonardo Trasande and Yinghua Liu. Reducing The Staggering Costs Of Environmental Disease In Children, Estimated At \$76.6 Billion In 2008. *Health Affairs*, 30, no.5 (2011):863-870

The Price of Pollution: Cost Estimates of Environment-Related Childhood Diseases in Michigan. 2010 Report by Michigan Network of Children’s Environmental Health

# Lead in Water

- Not what medicine/public health used to
  - Lead paint obsessed
  - “drinking through a lead painted straw”
- Soluble metal – ingestion via particulate or dissolved in water
- Drinking and cooking risks

# Lead in water

- Disproportionally impacts developmentally-vulnerable formula-fed infants
  - For about 25% of infants drinking formula made from tap water at 10 ppb, blood lead would rise  $\geq 5$  ug/dL
- Significant risk to unborn babies
  - Increase in fetal deaths and reduced birth weights

Triantafyllidou, S., Gallagher, D. and Edwards, M. Assessing risk with increasingly stringent public health goals: the case of water lead and blood lead in children. Journal of Water and Health. doi: 10.2166/wh.2013.067 58-68 (2014).

Edwards, M. Fetal Death and Reduced Birth Rates Associated with Exposure to Lead-Contaminated Drinking Water. Env. Sci. and Tech. 2013 DOI: 10.1021/es4034952

# Hurley Children's **RESEARCH FINDINGS**

**Sept 24**

**Medical Community Press Conference**

# Methods

- HMC IRB approved
- Data from all blood lead levels processed at Hurley Medical Center
- ZIP code based
- Two periods of comparison (same seasons):
  - PRE-SWITCH: January 1, 2013 – September 15, 2013
  - WATER SWITCH APRIL 26, 2014
  - POST-SWITCH: January 1, 2015 – September 15, 2015
- Analyzed % Elevated Blood Lead (EBLL)
  - EBLL = Blood lead Levels  $\geq 5$  ug/dL

# Initial Research Results

- Zip code based (in media)

	<b>ALL FLINT ZIPS (n=1746)</b>	<b>HIGH-WLL FLINT ZIPS (48503-48504) (n=742)</b>	<b>NON- FLINT ZIPS (n=1670)</b>
<b>PRE-SWITCH</b>	<b>2.1%</b>	<b>2.5%</b>	<b>0.6%</b>
<b>POST- SWITCH</b>	<b>4.0%</b>	<b>6.3%</b>	<b>1.0%</b>

# GEOcoded Analysis

- N= 1473 for Flint water children (pre n=736, post n=737)
- N= 2202 for non-Flint water children (pre n=1210, post n=992)

## **Flint results for children 5 years and under:**

- PRE-SWITCH % EBLL: **2.4%**
- POST-SWITCH % EBLL: **4.9%**
- **$p < 0.05$ ; STATISTICALLY SIGNIFICANT CHANGE**

Flint City Wards  
Major Streets

## CITY OF FLINT MAJOR WATER INFRASTRUCTURE

### WATER AGE & WATER SAMPLE LOCATION MAP

January 21, 2015

# Pre/Post EBLL

Comparison of Pre/Post EBL Percentage

\*p<0.05

# Research results

- % of children with EBLL in Flint zips increased
  - Most striking increase in areas with highest water lead levels
- **Results significantly underestimate exposure:**
  - Infants not screened for lead
  - BLL may have peaked before being measured (blood half life 20-30 days)
  - Kids exposed in different settings throughout city
- Widened disparities
- Failure of primary prevention

# What happened next?

- Sept 25 City of Flint Lead Health Advisory
- Sept 29 GCHD Health Advisory
- Oct 1 GCHD Public Health Emergency
- Oct 2 State filter program, increased water testing, expedited corrosion control
  - Oct 3 First filter distribution
- Oct 8 Three schools toxic WLL, announced reconnection to DWSD
- Oct 16 Water switched back to DWSD

## Wayne State Researchers Discover Evidence That Lead Exposure in Mothers Can Affect Future Generations

Released: 2-Oct-2015 3:05 PM EDT

Source Newsroom: Wayne State University Division of Research

“A team of researchers at Wayne State University have discovered that mothers with high levels of lead in their blood not only affect the fetal cells of their unborn children, but also their grandchildren. “

HURLEY  
MEDICAL CENTER

# Now

HURLEY  
CHILDREN'S  
HOSPITAL

- Preventable population-wide exposure
- Community traumatized
- Loss of trust in government and agencies
  - In 2015, in the middle of the great lakes, no guarantee of safe drinking water
- Ongoing public health emergency

HURLEY  
MEDICAL CENTER

# Exposed Population

- Currently identifying/labeling exposed population
- Cohort includes all children less than 6 years who at any time lived in Flint water limits (geocoded) from April 2014 to end date unknown (extend 9 months for fetal exposure).
- Per census data, approx. 8,000-9,000 children

# **Quick Introduction to ACEs/Toxic Stress...**

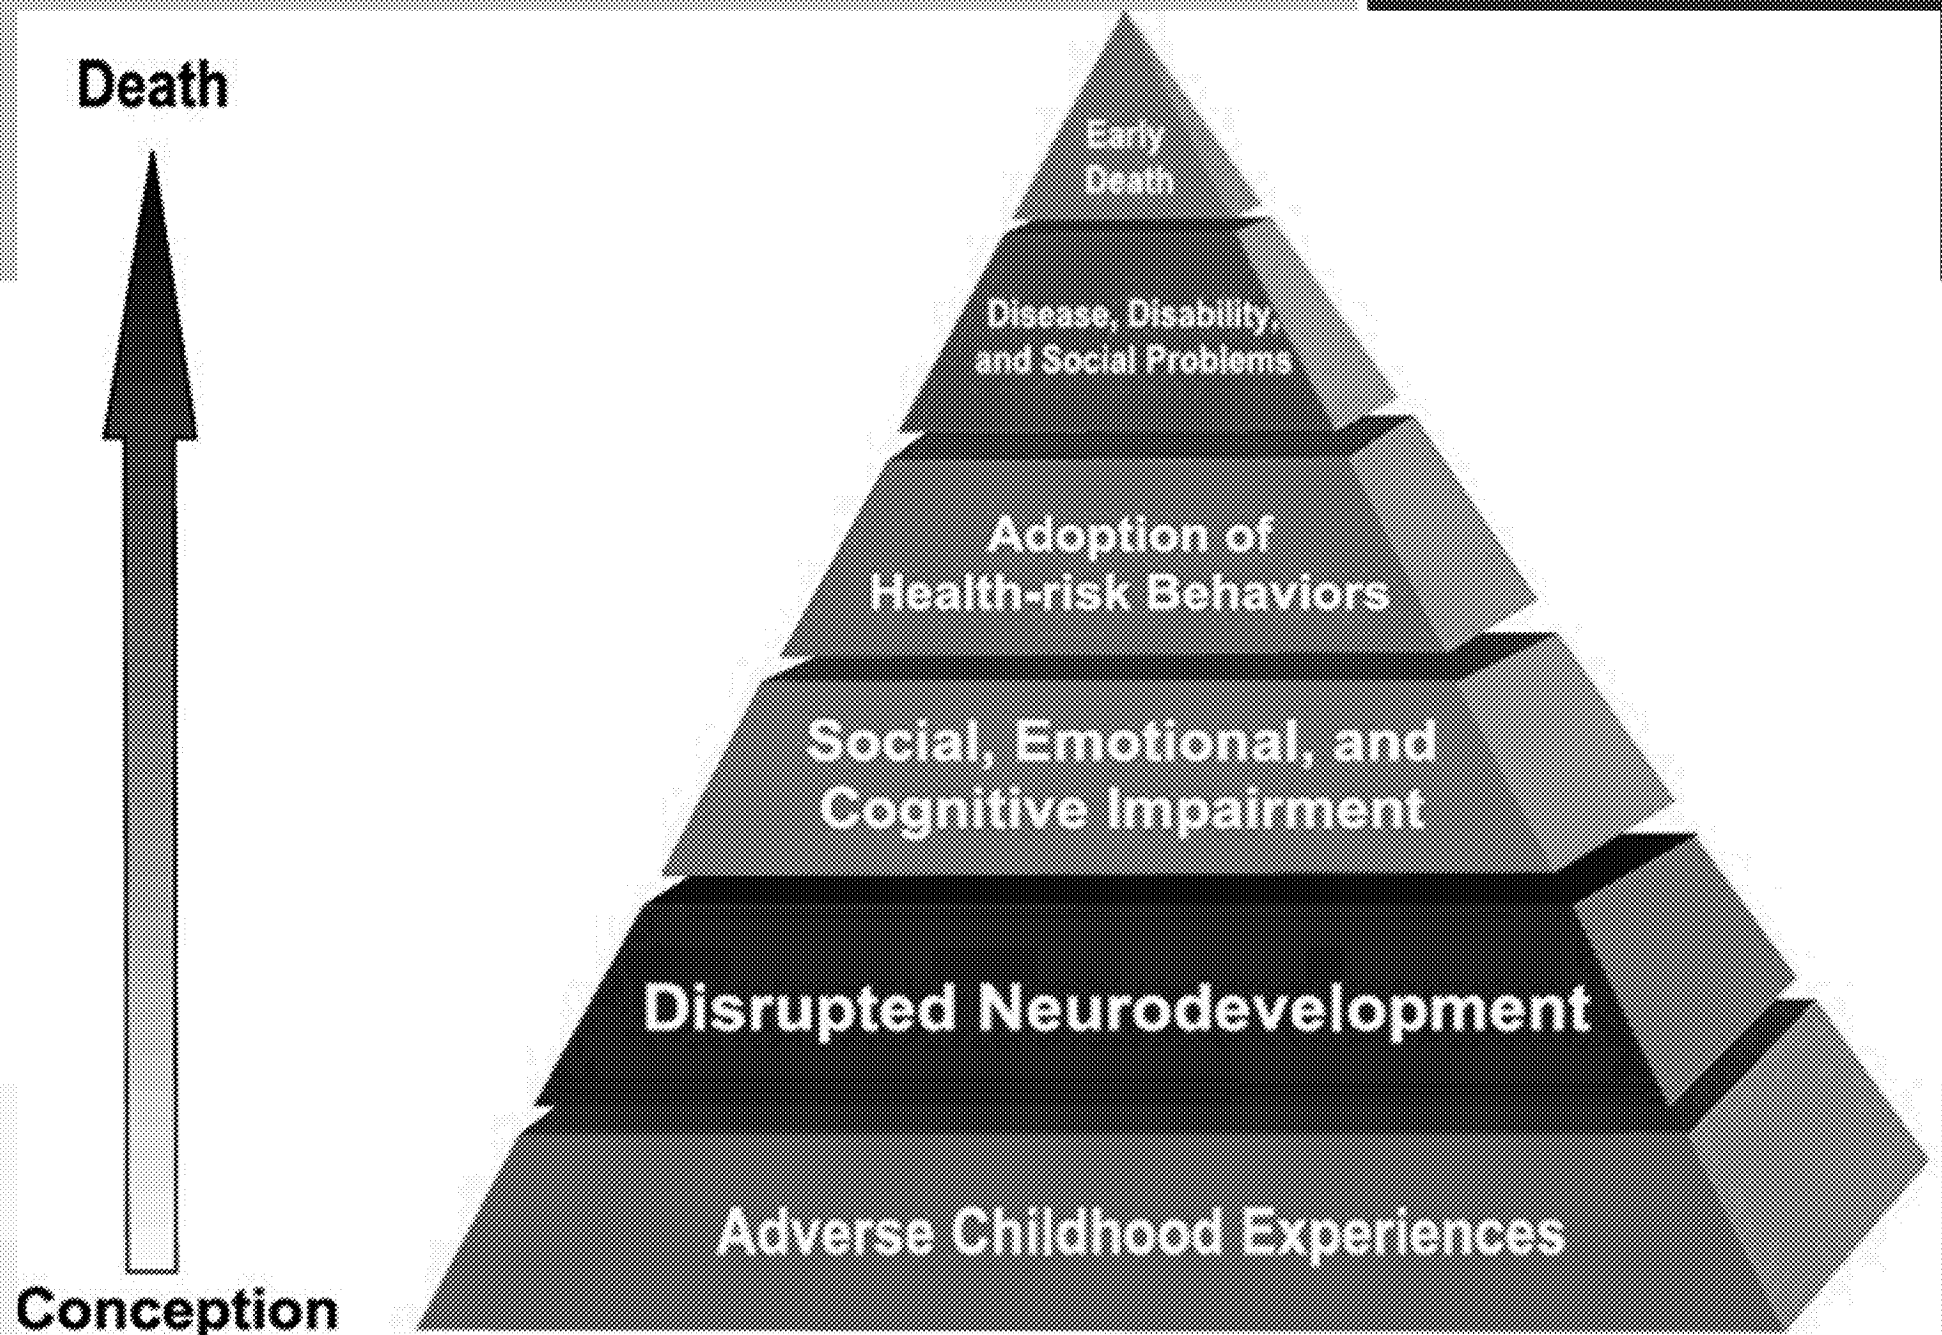

# Adverse Childhood Experiences (ACEs)

- ACEs are potentially traumatic events that can have negative, lasting effects on health and well-being.
  - Also referred to as toxic stress or childhood trauma.
  - As number of ACEs increase, the risk for health problems increase in a strong and graded fashion.
  - An ACE score of 6 or more results in a 20 year decrease in life expectancy.
- 
- CDC ACE study
    - Kaiser Permanente from 1995 to 1997 with more than 17,000 participants.

● Now what can we do???

## ● Assess the impact of the exposure

- Health impact
  - BLL
  - Longitudinal neurodevelopmental f/u
  - Cord blood Pb, brain injury markers, epigenetics
  - Retrospective fetal deaths, IUGR
- Nutrition impact
- Psychosocial impact
- Water quality/infrastructure impact

## ● Continued monitoring

- Academic/public health collaborations

# Secondary Prevention

- Unique opportunity to be proactive, to regain public trust, and to **buffer** impact of exposure
  - Short Term
  - Long Term

# Short-Term Secondary Prevention

- Consistent, coordinated, multi-method, trusted messaging/education/risk communication/PSAs
  - Need for central command/hub/emergency response

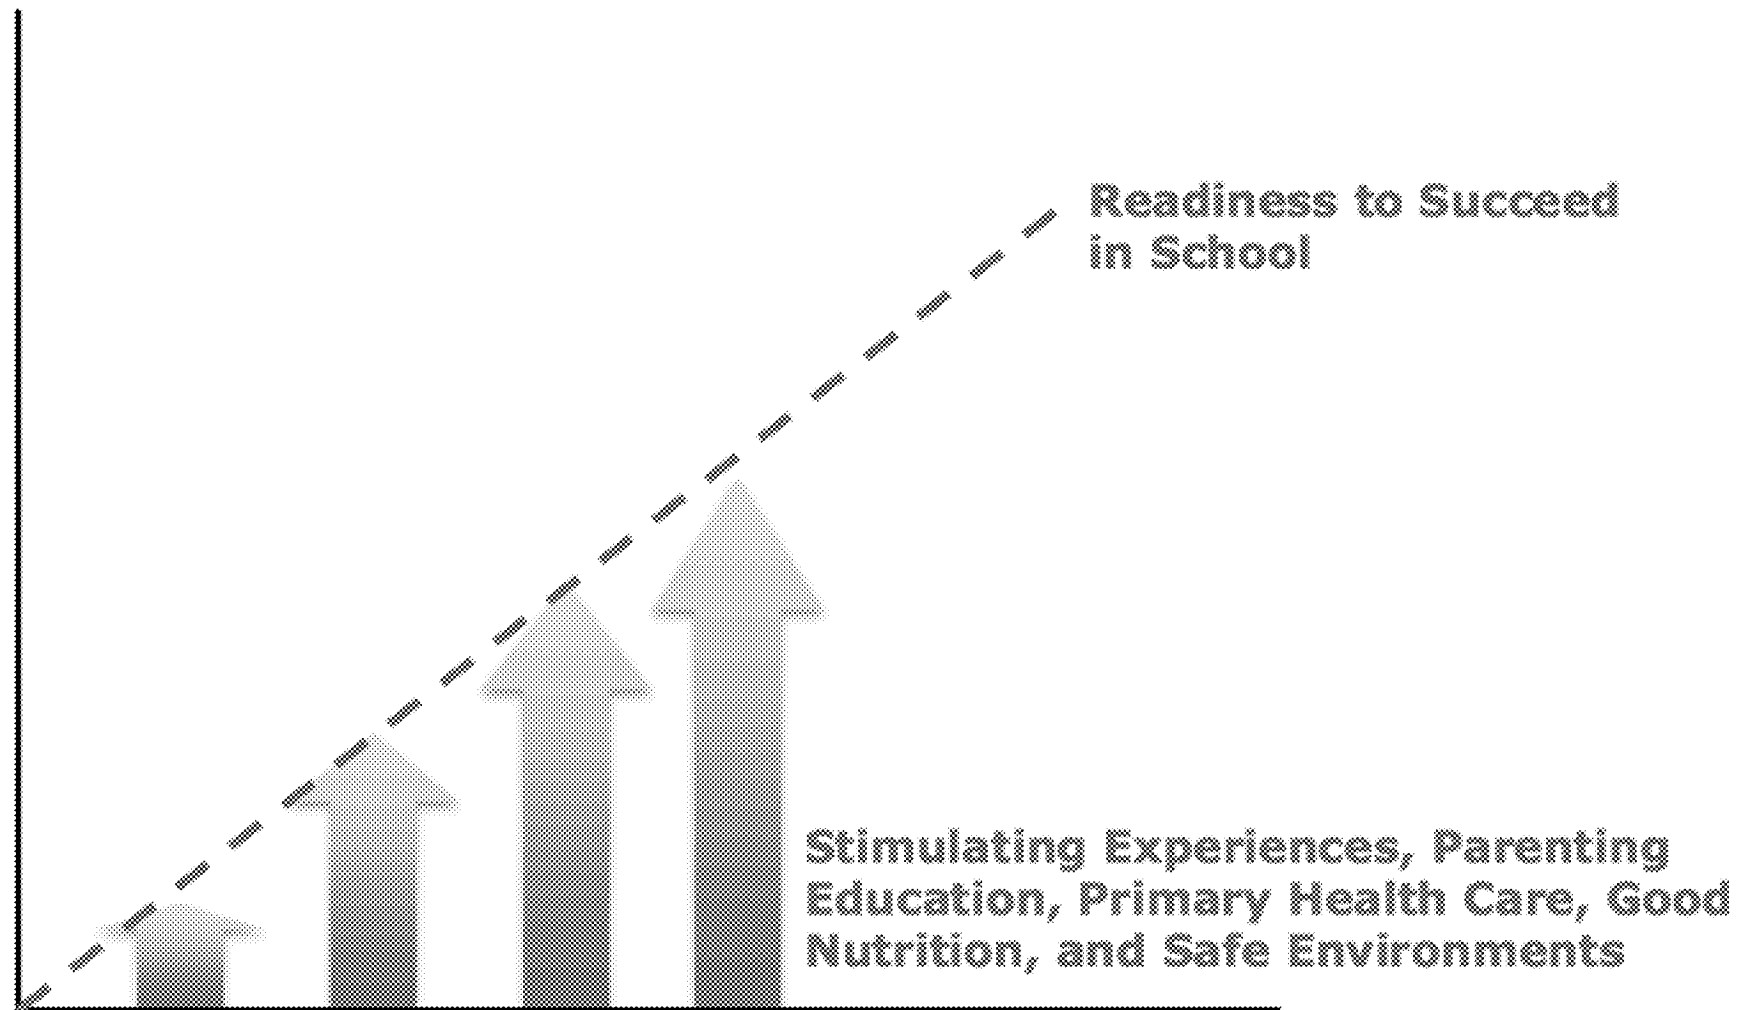

# Short-Term Secondary Prevention

- Water still not safe (public health emergency)
  - Corrosion control optimization
  - Ongoing risk from scale disruption
  - Door to door filter/replacement distribution
    - # filters distributed approx 1/3 of homes
  - Public education re water precautions (filters, flushing, cold water, cooking, infants, etc)
  - Lead plumbing

# **Secondary Prevention Evidence Based Interventions**

## Secondary Prevention

- Medical/Health
- Nutrition
- Education
- Caregiver capacity
- Water quality

# Secondary Prevention

## *Medical/Health*

- Support and education for primary care providers regarding aggressive long-term neurodevelopmental screening & testing
- Improve access to Developmental and Behavioral (DBP) specialists, pediatric psychologists, pediatric psychiatrists
  - Preemptive referral to mental health/toxic stress screening
  - Support capacity building and/or incentivize recruitment to allow Genesee Health System (CMH) to build this capacity which is currently needed and lacking
- Increase recognition and education regarding trauma informed care, social determinants of health (SDOH)
- Consider health fund/enrollment in Children's Special Health Care Services (CSHCS) for exposed kids to cover long-term needs

# Secondary Prevention Medical/Health

- Expand state-funded Genesee Health System (CMH) services
  - Infant Mental Health (30 capacity)
  - Child case management
  - Home-based services
  - Trauma informed care – trauma focused CBT

# Secondary Prevention

## *Medical/Health*

- Role of Medicaid HMO plans:
  - Support to drive patients to medical home: enhanced transportation, case management, HEDIS monitoring, pt incentives, mental health access, etc
  - Reimbursement for integrated social work, registered dietician, mental health services, OT/PT services
  - Encourage collaboration/mandate support of Genesee Children's Healthcare Access Program (CHAP)

# Hurley Children's Clinic

*Thinking Outside The Box*

HURLEY  
CHILDREN'S  
HOSPITAL

- Transportation
- Social work
- WIC RD/Nutrition
- Peds Psychology
- Training site

HURLEY  
MEDICAL CENTER

# Secondary Prevention

## *Nutrition*

- Short-term mitigation/protection
  - Promotion/education of Iron, Calcium, Vit C diets
- Promote enrollment and participation in pre-existing nutrition resources (WIC, SNAP, DUFB, MTA)
- Expand WIC eligibility, access (co-locate with PMD), benefits

# Secondary Prevention

## *Nutrition*

- Improve food access/security efforts via subsidies, pilots – grocery stores, mobile groceries, urban farming, etc
  - Buy/limit liquor licenses
- Invest in breastfeeding promotion, education, and support services

# Secondary Prevention *Education*

- Subsidize quality childcare options
- Automatic referral/assessment by Early Intervention (Early On)
- Enroll all in early head start, head start
  - Universal Pre-school/Flint Pre-Promise
- Strengthen special education capacity/trained personnel

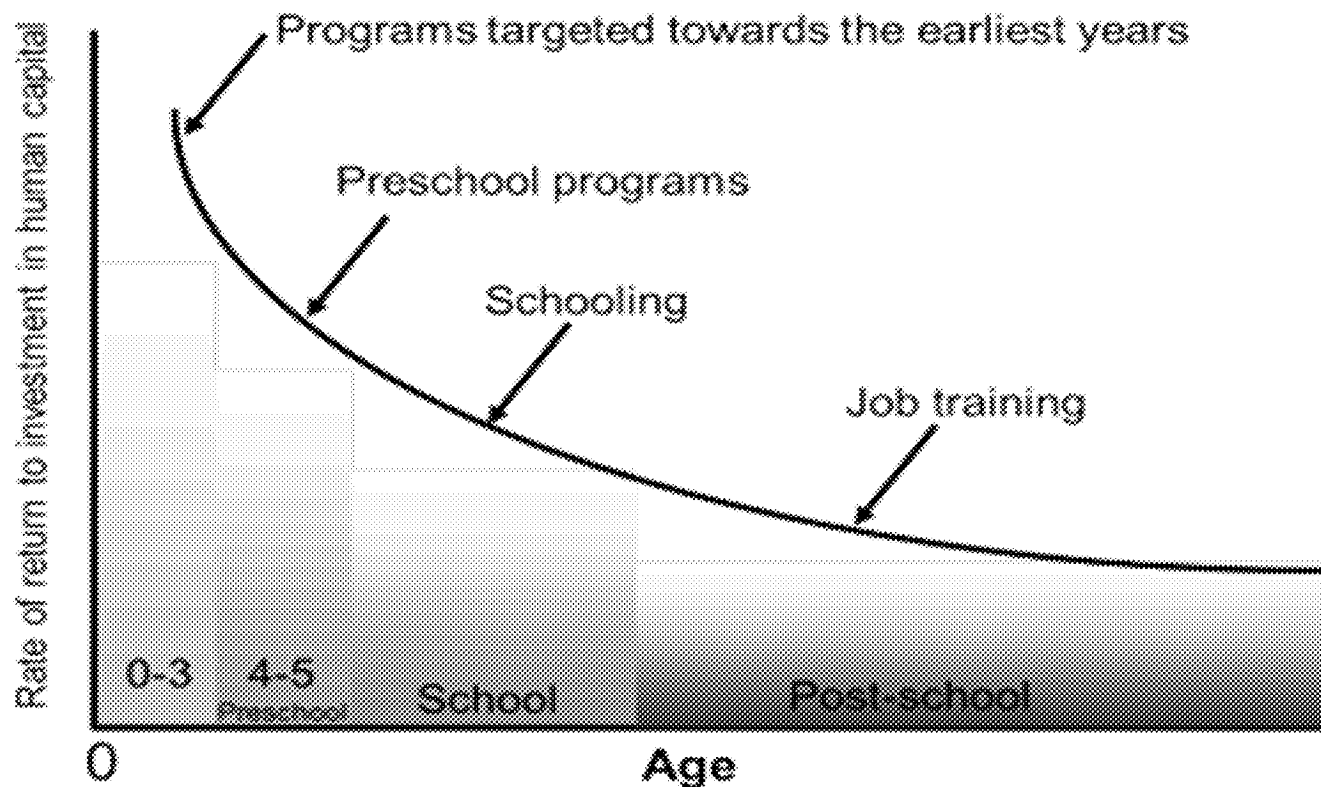

# Secondary Prevention *Education*

- Invest in school health/wellness/behavioral health
  - School nurse:student ratio – MI ranked worst in country
  - 1:750 recommended
  - 1:6,500 Flint
- Place MDHHS employee at every school
- Model lead safe school campaigns
  - Proactive water testing, lead plumbing investigations
  - Lead mitigating school nutrition

# Investing in Children: Younger The Better

HURLEY  
CHILDREN'S  
HOSPITAL

## Rates of Return to Human Capital Investment at Different Ages: Return to an Extra Dollar at Various Ages

<https://www.aap.org/en-us/advocacy-and-policy/federal-advocacy/Documents/Panel%202%20-%20Marks%20RWJF%20Presentation.pdf>

HURLEY  
MEDICAL CENTER

# Secondary Prevention

## *Caregiver capacity*

- Toxic stress and resilience
  - “Strong, frequent, and/or prolonged activation of the body’s stress-response system in the absence of the **buffering protection of a supportive, adult relationship.**”

Shonkoff, J & Garner, A. (2012) The lifelong effects of early childhood adversity and toxic stress. *Pediatrics*, 129(1). 232-246.

# Secondary Prevention

## *Caregiver capacity*

- Need to support parents and programs to improve parenting skills
- Evidence-based parenting programs
  - Incredible Years (HCH AAP Grant)
  - Triple P
  - Everyday Parenting
  - Adventures in Parenting
  - Home visiting programs
  - Strengthening Families Framework
  - Maternal Infant Health Program (MIHP)
  - Healthy Start
  - Nurse Family Partnership (NFP)

# Nurse Family Partnership

- 56% reduction in emergency room visits for accidents and poisonings in the second year of the child's life
- 50% reduction in behavioral problems when the children enter school.
- 48% reduction in state-verified reports of child abuse and neglect by child age 15
- 39% fewer healthcare encounters for injuries or ingestions in the first two years of life
- Increase in language scores

# Secondary Prevention

## *Caregiver capacity*

- Increase support for state-funded NFP, Healthy Start and MIHP
  - Hurley-run NFP capacity for 100

# Secondary Prevention

## *Water Safety/Infrastructure*

- Opportunity to model best practices for lead in water monitoring to protect public health rather than a focus on minimum compliance
  - EPA Flint Safe Drinking Water Taskforce
- Flint will change water source and treat water again once connected to KWA (2016), should not be rushed
- Full lead plumbing replacement (can be targeted)

# Next Steps

- Primary prevention failed
  - Preventable population-wide exposure
- Secondary prevention must be priority
- Invest and prioritize in evidence based interventions that mitigate exposure and build childhood resilience
  - Ages 0 to 6 years critical for life course trajectory

# Top Five Interventions

1. Support for emergency response
2. Increase funding/capacity for home visiting maternal-infant support programs
3. Guarantee Flint Pre-Promise (3-5 year quality early education)
4. Fund RN in every Flint school
5. Encourage innovative Medicaid HMO plan and medical home initiatives (ie: CHAP)

**It's easier to build strong children  
than to repair broken men.**

**Frederick Douglass, 1855**

Team:

I have received all of the input provided and thank you. The following highlights:

- The only two “enterprise wide” folks we have as Coordinators are Harvey Hollins and Chris Kalenske. I have changed their titles to reflect a coordination/facilitation role and not connote “We are in charge and to hell with everyone else”. Therefore I have changed the org chart and created a “dotted line” depiction—and also added the Legislative body as they (or subsets) may have a role here as well.
- But make no mistake, we are going to be accountable whether we should be or not so we are not syndicated the leadership that comes with the coordinating roles. I rewrote certain pieces of the proposal to reflect our inclusion, equality and partnership. But make no mistake, Harvey and Chris are the guys who will make this coordination effort work and if either of them encounter resistance with any of our partners in this effort, I have pledged to have their backs using my persuasive charm and bankruptcy tested mediation skills...
- I did not bring in more departments at this time. That is not to say they would not be value add, but there is a difference between an emergency response and planning effort, and introducing some other ways to get help and support to Flint. We will do that too, but not at this time.

- I have attached Tim Becker's Supplemental Request. Note that even at \$6 million over 2 years it does not include funding for the sort of long term monitoring of consequences of lead impact.
- Lastly I want people to know that we are committed to a spirit of inclusion, even with those who have been relentless in their attacks without offering any insights to solutionality. But some of these people have a stronger interest in advancing their own personal agenda and not devoting any real efforts to solving real problems. They will only be welcome if they decide to pursue the latter behavior vs. the former.

Unless someone thinks I really botched something up in the proposal, I would now ask Jarrod to give it final blessing and share with the Governor to get confirmation on the way forward.

Thanks everyone for a less than 24 hour turnaround and...

Go Green

Ok ok...Go Blue too...

HNY,

Rich

## A Proposal to Create the Flint Water Inter-Agency Coordinating Committee (FIACC)

In collaboration with the Flint After-Action Task Force, MSP Captain Chris Kelenske, DHHS Chief Deputy Tim Becker and DHHS Director Nick Lyon, Harvey Hollins and Rich Baird are recommending the immediate creation of the above referenced entity, with its sustained role and responsibility enabled under the Governor's Executive Order.

### Statement of Need

Due to a combination of resource constraints, inexperienced personnel, "silo" bureaucratic processes and the need to react to immediate problems, there is a lack of coordination, communication, and connected management amongst the departments and stakeholders who must work together to ensure Flint's return to clean, safe water and to coordinate mid and long term efforts to mitigate and address future health and behavioral consequences from lead ingestion. This group **MUST** be stood up regardless of whether (or when) the conditions required for a declaration of emergency are met by the City, County, State or Federal authorizers.

This inter agency group must fully engage with those we seek to serve. Equal partners. Equal leadership. Equal responsibility. Equal chance to be part of the solution to an important and not fully understood problem. We need our fellow citizens to be our partners in finding a solution, to feel they and their city and community leaders are not just part of the solution but are leading the solution with partners they can trust. This entity needs to be coordinated by State of Michigan leaders who represent statewide resources and constituencies and the citizens who comprise them. This coordinating body must include:

- The creation of a routine information process between all parties.
- Pursuit of other avenues of funding including federal grants and legislative appropriations.
- While the Emergency Management Act or the Stafford Disaster Relief and Emergency Assistance Act may be mechanisms to fix the issues in Flint, portions of the Emergency Management Act outlining management of events are applicable and should be implemented without delay (e.g. Local emergency operations plans/emergency operations guides as well as emergency operations support plans).

### Action Plan and Establishing the FIACC

It appears that a request for a Governor's declaration may be coming from Genesee County as quickly as January 4, 2016. The state's Emergency Coordinator (Capt. Kelenske) will evaluate the request and provide a recommendation whether to issue a declaration, following established protocol and due diligence. But immediately, we will:

1. Establish an interagency workgroup coordinated by Harvey Hollins and Chris Kelenske (who will be actively supported in their work by Rich Baird), and be comprised of DHHS, MDEQ, MSP, Treasury, Genesee County, City of Flint, MDE, LARA and external Subject Matter Experts (SMEs). Civil Rights and MSHDA may be added at a later time. If additional agencies/stakeholders who can assist with accomplishing the action plan are needed, they will be added. Personnel must be goal oriented, transparent with findings and measures of progress, and able to work toward accomplishing the Incident Action Plan created by the state in a timely manner. This is not a discussion or policy group.

It is an active problem solving, execution oriented group of professionals of equal stature completely dedicated to the Flint solution and remediation, and enabled by the statewide capabilities of the coordinators. Staff will be needed with competencies in disaster/emergency planning, operations, logistics and finance as outlined under the National Incident Management System (NIMS). These management components are accountable to the coordinating leadership to ensure tracking of resource requests, and incident action plan items are created, documented and completed. A draft Organization Chart is attached under separate cover and the “dotted lines” depict a non-hierarchical structure where the members commit to working, communicating and sharing collectively vs departmentally.

2. This body should be created by Executive Order and it must complement and not replace the current system under the Emergency Management Act. In fact, it should demonstrate how to best leverage support where existing laws fall short under a man-made emergency.
3. Utilize the National Incident Management System and Unified/Incident Command as appropriate.
4. Establish routine communications protocols at the operational, executive, and legislative levels as determined appropriate.
5. Establish interagency workgroup objectives using the following as a starting point.

#### Interagency Workgroup Objectives

1. Determine and convey acceptable standards for potable water.
  - Identify needed remediation.
  - Convey the remediation plan objectives to all stakeholders and interested parties.
  - Logistics plan for distribution and serving homebound citizens with water and filtration
  - Implement the plan.
2. Determine health impacts for the impacted population.
  - Identify treatment methods.
  - Nutrition education and support
  - Coping with lead exposure (care, monitoring, neurodevelopmental screening, access to DBP specialists, psychologists/psychiatrists, expanded county services, etc.)
  - Convey the treatment plan objectives to interested parties.
  - Implement the plan.
3. Establish a public information protocol to effectively inform the community of the situation and actions taken.
  - Identify existing Public Information outlets within the city, county, and state.
  - Establish a Joint Information Center
  - Provide for Emergency Alerts and Updates
  - Leverage public and private education schools
  - Determine official information flow and approval of information.
  - Convey to interested parties.
4. Assess the status of the infrastructure and determine feasible actions to upgrade the water system.
  - Determine current state of the infrastructure.

- Develop priorities, costs, and potential funding sources for infrastructure upgrades as part of a long term recovery plan.
- Seek partners to assist (NGOs, Foundations, Business, etc.)
- Implement the plan.

#### Next Steps

1. Input to this plan has been received and incorporated where feasible. Chief of Staff Jarrod Agen gives final draft approval and reviews with Governor Snyder as soon as possible but not later than Saturday, January 2, 2016
2. Governor Snyder reviews approves/adjusts and decides on the plan and authorizes Harvey Hollins to provide the plan to Mayor Karen Weaver on Saturday or Sunday, January 3, 2016.
3. As a courtesy, I would like to share the plan with the Flint WAATF after it has been provided to Mayor Weaver.
4. Communications should have a strategy on when this plan gets released publically (before, during or after the expected Emergency Declaration by Genesee County. If there is no declaration, we should proactively communicate (and perhaps share the communication with the TF).
5. We are not contemplating activating the State Emergency Operations Center (SEOC) until AFTER Genesee County has demonstrated they did all they conceivably could have done, utilized all available resources to include contracts and mutual aid, and couldn't solve the problem. That is what is required under the Emergency Management Act.
6. MDHHS has put forth a supplemental budget request for FY 16 and 17 for testing, outreach, education, etc. It does not contemplate behavioral or cognitive remediation in the event of lead poisoning.

5	<b>Detailed Description</b>
6	
7	
8	
9	Support two epidemiologists to analyze blood lead levels based on zip codes in the City of Flint. Work conducted by the epidemiologists will be new functions not currently conducted. Positions will be supported through contracts with MPHIL. Costs reflect contractual and service costs to abate lead from homes in the City of Flint. Contractual funds will support 3.5 contractual staff - 2.5 field consultants to conduct abatement and one to assist with client application and form processing (total \$187,500). Funds for the service include the cost to abate 100 homes @ \$15,000 each (\$1.5 million) which will include internal housing plumbing components where necessary. Current efforts financed in the previous FY16 supplemental did not support lead abatement activities.
10	Additional contractual efforts to support lead investigations in 100 additional homes in the City of Flint. Service will be provided by ETC Consulting.
11	Funds support the increased testing and follow up necessary with the new homes being investigated. Nurse case managers provide follow up with families, provide nutrition counseling, and coordination with Environmental Blood Level (EBL) investigations.
12	Contractual FTEs will work with the Genesee County Health Department (GCHD) to build educational efforts in that community to develop a more detailed education plan.
13	One contractual peer educator FTE at Genesee County Health Department to help increase WIC enrollment and retention to assist with lead testing, nutrition education, and overall health of pregnant moms and infants.
14	
15	
16	
17	
18	
19	Continue the funds from the original FY16 supplemental for existing nurse case management of EBL home investigations.
20	Continue the funds from the FY16 request above and support two epidemiologists to analyze blood lead levels and will address broader areas beyond the City of Flint. Work conducted by the epidemiologists will be new functions not currently conducted.
21	Continue the funds from the FY16 request above and finance contractual and service costs to abate lead from homes in the City of Flint. Contractual funds will support 4 contractual staff - 3 field consultants to conduct abatement and one to assist with client application and form processing (total \$311,000). Funds for the service include the cost to abate an increase to 130 homes @ \$15,000 each (\$1.95 million) which will include internal housing plumbing components where necessary. Current efforts financed in the previous FY16 supplemental did not support lead abatement activities.

Team:

I have received all of the input provided and thank you. The following highlights:

- The only two “enterprise wide” folks we have as Coordinators are Harvey Hollins and Chris Kalenske. I have changed their titles to reflect a coordination/facilitation role and not connote “We are in charge and to hell with everyone else”. Therefore I have changed the org chart and created a “dotted line” depiction—and also added the Legislative body as they (or subsets) may have a role here as well.
- But make no mistake, we are going to be accountable whether we should be or not so we are not syndicated the leadership that comes with the coordinating roles. I rewrote certain pieces of the proposal to reflect our inclusion, equality and partnership. But make no mistake, Harvey and Chris are the guys who will make this coordination effort work and if either of them encounter resistance with any of our partners in this effort, I have pledged to have their backs using my persuasive charm and bankruptcy tested mediation skills...
- I did not bring in more departments at this time. That is not to say they would not be value add, but there is a difference between an emergency response and planning effort, and introducing some other ways to get help and support to Flint. We will do that too, but not at this time.

- I have attached Tim Becker's Supplemental Request. Note that even at \$6 million over 2 years it does not include funding for the sort of long term monitoring of consequences of lead impact.
- Lastly I want people to know that we are committed to a spirit of inclusion, even with those who have been relentless in their attacks without offering any insights to solutionality. But some of these people have a stronger interest in advancing their own personal agenda and not devoting any real efforts to solving real problems. They will only be welcome if they decide to pursue the latter behavior vs. the former.

Unless someone thinks I really botched something up in the proposal, I would now ask Jarrod to give it final blessing and share with the Governor to get confirmation on the way forward.

Thanks everyone for a less than 24 hour turnaround and...

Go Green

Ok ok...Go Blue too...

HNY,

Rich

## A Proposal to Create the Flint Water Inter-Agency Coordinating Committee (FIACC)

In collaboration with the Flint After-Action Task Force, MSP Captain Chris Kelenske, DHHS Chief Deputy Tim Becker and DHHS Director Nick Lyon, Harvey Hollins and Rich Baird are recommending the immediate creation of the above referenced entity, with its sustained role and responsibility enabled under the Governor's Executive Order.

### Statement of Need

Due to a combination of resource constraints, inexperienced personnel, "silo" bureaucratic processes and the need to react to immediate problems, there is a lack of coordination, communication, and connected management amongst the departments and stakeholders who must work together to ensure Flint's return to clean, safe water and to coordinate mid and long term efforts to mitigate and address future health and behavioral consequences from lead ingestion. This group **MUST** be stood up regardless of whether (or when) the conditions required for a declaration of emergency are met by the City, County, State or Federal authorizers.

This inter agency group must fully engage with those we seek to serve. Equal partners. Equal leadership. Equal responsibility. Equal chance to be part of the solution to an important and not fully understood problem. We need our fellow citizens to be our partners in finding a solution, to feel they and their city and community leaders are not just part of the solution but are leading the solution with partners they can trust. This entity needs to be coordinated by State of Michigan leaders who represent statewide resources and constituencies and the citizens who comprise them. This coordinating body must include:

- The creation of a routine information process between all parties.
- Pursuit of other avenues of funding including federal grants and legislative appropriations.
- While the Emergency Management Act or the Stafford Disaster Relief and Emergency Assistance Act may be mechanisms to fix the issues in Flint, portions of the Emergency Management Act outlining management of events are applicable and should be implemented without delay (e.g. Local emergency operations plans/emergency operations guides as well as emergency operations support plans).

### Action Plan and Establishing the FIACC

It appears that a request for a Governor's declaration may be coming from Genesee County as quickly as January 4, 2016. The state's Emergency Coordinator (Capt. Kelenske) will evaluate the request and provide a recommendation whether to issue a declaration, following established protocol and due diligence. But immediately, we will:

1. Establish an interagency workgroup coordinated by Harvey Hollins and Chris Kelenske (who will be actively supported in their work by Rich Baird), and be comprised of DHHS, MDEQ, MSP, Treasury, Genesee County, City of Flint, MDE, LARA and external Subject Matter Experts (SMEs). Civil Rights and MSHDA may be added at a later time. If additional agencies/stakeholders who can assist with accomplishing the action plan are needed, they will be added. Personnel must be goal oriented, transparent with findings and measures of progress, and able to work toward accomplishing the Incident Action Plan created by the state in a timely manner. This is not a discussion or policy group.

It is an active problem solving, execution oriented group of professionals of equal stature completely dedicated to the Flint solution and remediation, and enabled by the statewide capabilities of the coordinators. Staff will be needed with competencies in disaster/emergency planning, operations, logistics and finance as outlined under the National Incident Management System (NIMS). These management components are accountable to the coordinating leadership to ensure tracking of resource requests, and incident action plan items are created, documented and completed. A draft Organization Chart is attached under separate cover and the “dotted lines” depict a non-hierarchical structure where the members commit to working, communicating and sharing collectively vs departmentally.

2. This body should be created by Executive Order and it must complement and not replace the current system under the Emergency Management Act. In fact, it should demonstrate how to best leverage support where existing laws fall short under a man-made emergency.
3. Utilize the National Incident Management System and Unified/Incident Command as appropriate.
4. Establish routine communications protocols at the operational, executive, and legislative levels as determined appropriate.
5. Establish interagency workgroup objectives using the following as a starting point.

#### Interagency Workgroup Objectives

1. Determine and convey acceptable standards for potable water.
  - Identify needed remediation.
  - Convey the remediation plan objectives to all stakeholders and interested parties.
  - Logistics plan for distribution and serving homebound citizens with water and filtration
  - Implement the plan.
2. Determine health impacts for the impacted population.
  - Identify treatment methods.
  - Nutrition education and support
  - Coping with lead exposure (care, monitoring, neurodevelopmental screening, access to DBP specialists, psychologists/psychiatrists, expanded county services, etc.)
  - Convey the treatment plan objectives to interested parties.
  - Implement the plan.
3. Establish a public information protocol to effectively inform the community of the situation and actions taken.
  - Identify existing Public Information outlets within the city, county, and state.
  - Establish a Joint Information Center
  - Provide for Emergency Alerts and Updates
  - Leverage public and private education schools
  - Determine official information flow and approval of information.
  - Convey to interested parties.
4. Assess the status of the infrastructure and determine feasible actions to upgrade the water system.
  - Determine current state of the infrastructure.

- Develop priorities, costs, and potential funding sources for infrastructure upgrades as part of a long term recovery plan.
- Seek partners to assist (NGOs, Foundations, Business, etc.)
- Implement the plan.

#### Next Steps

1. Input to this plan has been received and incorporated where feasible. Chief of Staff Jarrod Agen gives final draft approval and reviews with Governor Snyder as soon as possible but not later than Saturday, January 2, 2016
2. Governor Snyder reviews approves/adjusts and decides on the plan and authorizes Harvey Hollins to provide the plan to Mayor Karen Weaver on Saturday or Sunday, January 3, 2016.
3. As a courtesy, I would like to share the plan with the Flint WAATF after it has been provided to Mayor Weaver.
4. Communications should have a strategy on when this plan gets released publically (before, during or after the expected Emergency Declaration by Genesee County. If there is no declaration, we should proactively communicate (and perhaps share the communication with the TF).
5. We are not contemplating activating the State Emergency Operations Center (SEOC) until AFTER Genesee County has demonstrated they did all they conceivably could have done, utilized all available resources to include contracts and mutual aid, and couldn't solve the problem. That is what is required under the Emergency Management Act.
6. MDHHS has put forth a supplemental budget request for FY 16 and 17 for testing, outreach, education, etc. It does not contemplate behavioral or cognitive remediation in the event of lead poisoning.

2	
3	
4	
5	<b>Detailed Description</b>
6	
7	
8	
	Support two epidemiologists to analyze blood lead levels based on zip codes in the City of Flint. Work conducted by the epidemiologists will be new functions not currently conducted. Positions will be supported through contracts with MPHl.
9	
	Costs reflect contractual and service costs to abate lead from homes in the City of Flint. Contractual funds will support 3.5 contractual staff - 2.5 field consultants to conduct abatement and one to assist with client application and form processing (total \$187,500). Funds for the service include the cost to abate 100 homes @ \$15,000 each (\$1.5 million) which will include internal housing plumbing components where necessary. Current efforts financed in the previous FY16 supplemental did not support lead abatement activities.
10	
	Additional contractual efforts to support lead investigations in 100 additional homes in the City of Flint. Service will be provided by ETC Consulting.
11	
	Funds support the increased testing and follow up necessary with the new homes being investigated. Nurse case managers provide follow up with families, provide nutrition counseling, and coordination with Environmental Blood Level (EBL) investigations.
12	
	Contractual FTEs will work with the Genesee County Health Department (GCHD) to build educational efforts in that community to develop a more detailed education plan.
13	
	One contractual peer educator FTE at Genesee County Health Department to help increase WIC enrollment and retention to assist with lead testing, nutrition education, and overall health of pregnant moms and infants.
14	
15	
16	
17	
18	
	Continue the funds from the original FY16 supplemental for existing nurse case management of EBL home investigations.
19	
	Continue the funds from the FY16 request above and support two epidemiologists to analyze blood lead levels and will address broader areas beyond the City of Flint. Work conducted by the epidemiologists will be new functions not currently conducted.
20	
	Continue the funds from the FY16 request above and finance contractual and service costs to abate lead from homes in the City of Flint. Contractual funds will support 4 contractual staff - 3 field consultants to conduct abatement and one to assist with client application and form processing (total \$311,000). Funds for the service include the cost to abate an increase to 130 homes @ \$15,000 each (\$1.95 million) which will include internal housing plumbing components where necessary. ## A Proposal to Create the Flint Water Inter-Agency Coordinating Committee (FIACC)

In collaboration with the Flint After-Action Task Force, MSP Captain Chris Kelenske, DHHS Chief Deputy Tim Becker and DHHS Director Nick Lyon, Harvey Hollins and Rich Baird are recommending the immediate creation of the above referenced entity, with its sustained role and responsibility enabled under the Governor's Executive Order.

### Statement of Need

Due to a combination of resource constraints, inexperienced personnel, "silo" bureaucratic processes and the need to react to immediate problems, there is a lack of coordination, communication, and connected management amongst the departments and stakeholders who must work together to ensure Flint's return to clean, safe water and to coordinate mid and long term efforts to mitigate and address future health and behavioral consequences from lead ingestion. This group **MUST** be stood up regardless of whether (or when) the conditions required for a declaration of emergency are met by the City, County, State or Federal authorizers.

This inter agency group must fully engage with those we seek to serve. Equal partners. Equal leadership. Equal responsibility. Equal chance to be part of the solution to an important and not fully understood problem. We need our fellow citizens to be our partners in finding a solution, to feel they and their city and community leaders are not just part of the solution but are leading the solution with partners they can trust. This entity needs to be coordinated by State of Michigan leaders who represent statewide resources and constituencies and the citizens who comprise them. This coordinating body must include:

- The creation of a routine information process between all parties.
- Pursuit of other avenues of funding including federal grants and legislative appropriations.
- While the Emergency Management Act or the Stafford Disaster Relief and Emergency Assistance Act may be mechanisms to fix the issues in Flint, portions of the Emergency Management Act outlining management of events are applicable and should be implemented without delay (e.g. Local emergency operations plans/emergency operations guides as well as emergency operations support plans).

### Action Plan and Establishing the FIACC

It appears that a request for a Governor's declaration may be coming from Genesee County as quickly as January 4, 2016. The state's Emergency Coordinator (Capt. Kelenske) will evaluate the request and provide a recommendation whether to issue a declaration, following established protocol and due diligence. But immediately, we will:

1. Establish an interagency workgroup coordinated by Harvey Hollins and Chris Kelenske (who will be actively supported in their work by Rich Baird), and be comprised of DHHS, MDEQ, MSP, Treasury, Genesee County, City of Flint, MDE, LARA and external Subject Matter Experts (SMEs). Civil Rights and MSHDA may be added at a later time. If additional agencies/stakeholders who can assist with accomplishing the action plan are needed, they will be added. Personnel must be goal oriented, transparent with findings and measures of progress, and able to work toward accomplishing the Incident Action Plan created by the state in a timely manner. This is not a discussion or policy group.

It is an active problem solving, execution oriented group of professionals of equal stature completely dedicated to the Flint solution and remediation, and enabled by the statewide capabilities of the coordinators. Staff will be needed with competencies in disaster/emergency planning, operations, logistics and finance as outlined under the National Incident Management System (NIMS). These management components are accountable to the coordinating leadership to ensure tracking of resource requests, and incident action plan items are created, documented and completed. A draft Organization Chart is attached under separate cover and the “dotted lines” depict a non-hierarchical structure where the members commit to working, communicating and sharing collectively vs departmentally.

2. This body should be created by Executive Order and it must complement and not replace the current system under the Emergency Management Act. In fact, it should demonstrate how to best leverage support where existing laws fall short under a man-made emergency.
3. Utilize the National Incident Management System and Unified/Incident Command as appropriate.
4. Establish routine communications protocols at the operational, executive, and legislative levels as determined appropriate.
5. Establish interagency workgroup objectives using the following as a starting point.

#### Interagency Workgroup Objectives

1. Determine and convey acceptable standards for potable water.
  - Identify needed remediation.
  - Convey the remediation plan objectives to all stakeholders and interested parties.
  - Logistics plan for distribution and serving homebound citizens with water and filtration
  - Implement the plan.
2. Determine health impacts for the impacted population.
  - Identify treatment methods.
  - Nutrition education and support
  - Coping with lead exposure (care, monitoring, neurodevelopmental screening, access to DBP specialists, psychologists/psychiatrists, expanded county services, etc.)
  - Convey the treatment plan objectives to interested parties.
  - Implement the plan.
3. Establish a public information protocol to effectively inform the community of the situation and actions taken.
  - Identify existing Public Information outlets within the city, county, and state.
  - Establish a Joint Information Center
  - Provide for Emergency Alerts and Updates
  - Leverage public and private education schools
  - Determine official information flow and approval of information.
  - Convey to interested parties.
4. Assess the status of the infrastructure and determine feasible actions to upgrade the water system.
  - Determine current state of the infrastructure.

- Develop priorities, costs, and potential funding sources for infrastructure upgrades as part of a long term recovery plan.
- Seek partners to assist (NGOs, Foundations, Business, etc.)
- Implement the plan.

#### Next Steps

1. Input to this plan has been received and incorporated where feasible. Chief of Staff Jarrod Agen gives final draft approval and reviews with Governor Snyder as soon as possible but not later than Saturday, January 2, 2016
2. Governor Snyder reviews approves/adjusts and decides on the plan and authorizes Harvey Hollins to provide the plan to Mayor Karen Weaver on Saturday or Sunday, January 3, 2016.
3. As a courtesy, I would like to share the plan with the Flint WAATF after it has been provided to Mayor Weaver.
4. Communications should have a strategy on when this plan gets released publically (before, during or after the expected Emergency Declaration by Genesee County. If there is no declaration, we should proactively communicate (and perhaps share the communication with the TF).
5. We are not contemplating activating the State Emergency Operations Center (SEOC) until AFTER Genesee County has demonstrated they did all they conceivably could have done, utilized all available resources to include contracts and mutual aid, and couldn't solve the problem. That is what is required under the Emergency Management Act.
6. MDHHS has put forth a supplemental budget request for FY 16 and 17 for testing, outreach, education, etc. It does not contemplate behavioral or cognitive remediation in the event of lead poisoning.

1		
2		
3		
4		
5	<b>Detailed Description</b>	
6		
7		
8		
9	Support two epidemiologists to analyze blood lead levels based on zip codes in the City of Flint. Work conducted by the epidemiologists will be new functions not currently conducted. Positions will be supported through contracts with MPHIL. Costs reflect contractual and service costs to abate lead from homes in the City of Flint. Contractual funds will support 3.5 contractual staff - 2.5 field consultants to conduct abatement and one to assist with client application and form processing (total \$187,500). Funds for the service include the cost to abate 100 homes @ \$15,000 each (\$1.5 million) which will include internal housing plumbing components where necessary. Current efforts financed in the previous FY16 supplemental did not support lead abatement activities.	
10	Additional contractual efforts to support lead investigations in 100 additional homes in the City of Flint. Service will be provided by ETC Consulting.	
11	Funds support the increased testing and follow up necessary with the new homes being investigated. Nurse case managers provide follow up with families, provide nutrition counseling, and coordination with Environmental Blood Level (EBL) investigations.	
12	Contractual FTEs will work with the Genesee County Health Department (GCHD) to build educational efforts in that community to develop a more detailed education plan.	
13	One contractual peer educator FTE at Genesee County Health Department to help increase WIC enrollment and retention to assist with lead testing, nutrition education, and overall health of pregnant moms and infants.	
14		
15		
16		
17		
18		
19	Continue the funds from the original FY16 supplemental for existing nurse case management of EBL home investigations.	
20	Continue the funds from the FY16 request above and support two epidemiologists to analyze blood lead levels and will address broader areas beyond the City of Flint. Work conducted by the epidemiologists will be new functions not currently conducted.	
21	Continue the funds from the FY16 request above and finance contractual and service costs to abate lead from homes in the City of Flint. Contractual funds will support 4 contractual staff - 3 field consultants to conduct abatement and one to assist with client application and form processing (total \$311,000). Funds for the service include the cost to abate an increase to 130 homes @ \$15,000 each (\$1.95 million) which will include internal housing plumbing components where necessary. Current efforts financed in the previous FY16 supplemental did not support lead abatement activities.

31	Notes:		
32	(1) FY16 supplemental request reflects additional needs above the original supplemental level passed in November 2015.		
33	(2) FY16 levels support work to take place in the City of Flint only.		
34	(3) FY17 amounts are full year funding levels. Should the FY16 supplemental pass prior to the release of the FY17 Executive Recommendation, FY17 levels can be annualized to reflect the revised FY16 base.		

	E	
		Funds support additional lead environmental investigations. This is lead investigations in homes of children with high blood lead levels to determine all of the sources of lead exposure and plan for mitigation of lead. This does not include funding for lead abatement. This is done via contract with ETC Consulting. (No FTEs)
22		Continue the funds from the FY16 request above to support the increased testing and follow up necessary with the new homes being investigated. Nurse case managers provide follow up with families, nutrition counseling, and coordination with Environmental Blood Level (EBL) investigations.
23		Continue the contractual health educators at GCHD to work collaboratively with community agencies on awareness of lead hazards, increase lead testing, and nutrition education.
24		One contractual peer educator FTE at GCHD to help increase WIC enrollment and retention to assist with lead testing, nutrition education, and improve the overall health of pregnant moms and infants. Bus tokens (10,000 at \$1 = \$10,000), bus signs and other promotion materials for WIC at \$5,000.

Mark -- Here's the L Letter we sent last week to Medicaid providers.

The approach we discussed would be beneficial to those you cover in Flint. We have stepped up our testing, outreach, and education efforts with the local public health department in a very significant way since it became apparent that there was an increase in children testing above the 5 micrograms level. As we discussed we have also begun doing home blood lead investigations with the supplemental funding approved late last year. I think a critical component going forward will be care coordination with children (and adults) who test above the threshold, including nutrition counseling. Molina had indicated they are working with other providers so if you haven't heard from them, you might want to reach out.

Thanks for your efforts.

Nick

**Subject:** Numbered Letter L 15-73

Attached for your information is letter L 15-73, dated December 30, 2015.

L 15-73 – Blood Lead Guidelines to Address the City of Flint Residents' Potential Exposure to Lead.

This letter was sent to Practitioners, Clinics, Laboratories and Maternal Infant Health Program (MIHP) Providers in the City of Flint.

Medicaid Letters can be accessed on the web at [www.michigan.gov/medicaidproviders](http://www.michigan.gov/medicaidproviders) >> Communication and Training >> Click 2015 under Numbered Letters.

December 30, 2015

<Provider Name>  
<Provider Address1>  
<Provider Address2>  
<Provider City> <state> <zipcode5>-<zip4>

Dear Provider:

**RE: Blood Lead Guidelines to Address the City of Flint Residents' Potential Exposure to Lead**

Michigan Medicaid Early Periodic Screening, Diagnosis and Treatment (EPSDT) guidelines require children to be tested for blood lead poisoning at 12 and 24 months of age, and between 36 and 72 months of age if the child has not been previously tested as indicated by the Medicaid Provider Manual. The Manual is located at: [www.michigan.gov/medicaidproviders](http://www.michigan.gov/medicaidproviders) >> Policy and Forms.

Due to the enhanced public health issue of an increased risk for lead exposure in the City of Flint, providers have been advised to follow enhanced guidelines for lead testing in children:

- Providers should screen ALL children (regardless of Medicaid/insurance status) between 0 and 6 years of age that may have been exposed to the City of Flint drinking water after April 2014. Note: This includes all children less than 1 year of age and children between 3 and 6 years of age.
- If the child has already been screened since April 2014 by a capillary test, providers should follow-up on any elevated levels greater than 5 mcg/dl to ensure confirmatory venous testing is conducted.
- Providers should utilize the standard Blood Lead Level (BLL) Quick Reference for Primary Care Providers located at: [www.mi.gov/documents/deq/ProviderQuickReference\\_Sept2015\\_501831\\_7.pdf?20151204122739](http://www.mi.gov/documents/deq/ProviderQuickReference_Sept2015_501831_7.pdf?20151204122739).
- All clients with blood lead levels greater than 5 mcg/dl should be referred for case management coordinated through the Genesee County Health Department.
- Providers should inquire about the use of a drinking water filter and/or bottled water by all clients residing within the Flint city limits.
- Providers should inquire about other potential sources of lead within the household per the current recommendations of the Childhood Lead Poisoning Prevention Program's Statewide Lead Testing/Lead Screening Plan. The Statewide Lead Testing/Lead Screening Plan is located at: [www.michigan.gov/documents/mdch/testing-screening071009\\_287511\\_7.pdf](http://www.michigan.gov/documents/mdch/testing-screening071009_287511_7.pdf).

Lead testing performed using these enhanced testing guidelines is covered as a Medicaid EPSDT service. Providers should contact the beneficiary's Medicaid health plan for additional assistance if needed. Any questions regarding this letter should be directed to Provider Inquiry, Department of Health and Human Services, P.O. Box 30731, Lansing, Michigan 48909-8231, or e-mail at [ProviderSupport@michigan.gov](mailto:ProviderSupport@michigan.gov). When you submit an e-mail, be sure to include your name, affiliation, and phone number so you may be contacted if necessary. Providers may phone toll-free 1-800-292-2550.

Sincerely,

A handwritten signature in black ink, appearing to read "Chris Priest", with a stylized flourish extending from the end.

Chris Priest, Director  
Medical Services Administration

**Subject:** RE: schools not in Flint

I figured this would become a statewide issue at some point, this is sooner than I expected it.

Farah: Please notify SBO of the pressure exerted on us with the DEQ testing recommendation. I'm not sure they can do anything about it in the current supplemental. We may need to stretch the tests out over time as limited staffing permits.

**To:** Moran, Susan (DHHS)  
**Subject:** schools not in Flint

Sue,

Linda was on a call this morning with DEQ and Flint's Public Works director. During the call the DEQ staff indicated Wyant told them to prepare an army given that schools statewide will be encouraged to assess lead levels in drinking water.

I think MDHHS leadership needs to be made aware that we have a squadron but not an army. The submitted budget for the Flint situation includes an 0.2 or 0.25 FTE for toxicology but it can't be stretched to provide technical assistance for a statewide process. Would it help if Linda wrote a one-page proposal about what staffing is needed if this goes statewide, which I think it will.

Corinne

**From:** Dykema, Linda D. (DHHS)  
**Sent:** Friday, October 09, 2015 12:59 PM

**To:** Miller, Corinne (DHHS)

**Subject:** schools

<http://www.detroitnews.com/story/news/politics/2015/10/08/flint-water/73623958/>

State officials plan to contact all schools in the state, urging them to assess their lead levels in drinking water. Facilities built in the last quarter-century are unlikely to have lead issues, but others built before the mid-1980s may have lead connections and could be a problem, according to the agency.

“Schools that have lead infrastructure should be testing,” Wyant said.

**Subject:** Blood Lead Testing Report through 13Nov2015

Attached is the blood lead testing report through November 13, 2015 with updated Oct 1 to Oct 31 counts, Nov 1 to Nov 13 counts added, and summary text revised.

### Executive Summary

This report is generated by MDHHS to track Blood Lead Level test results in Flint, Michigan.

- Counts on this report include both capillary and venous blood tests. People who have had multiple tests are counted only once.
- Since 10/1/2015, an additional 1,395 people have been tested in Flint.
- Continued testing efforts by Genessee County Health Department, MDHHS and local medical personnel have identified 26 children with blood lead levels greater than or equal to 5µg/dL (micrograms per deciliter) since 10/1/2015.
- Three percent of the children younger than 6 years old tested since 10/1/2015 have had blood lead levels greater than or equal to 5µg/dL.
- Additional testing is ongoing. Counts will vary as new results are added.

### Number of People Tested for Lead in Flint

Total number of people tested for lead from 1/1/2013 to 4/14/2014	4657
Total number of people tested for lead from 4/15/2014 to 9/30/2015	5017
Total number of people tested for lead from 10/1/2015 to 10/31/2015:	1206
Total number of people tested for lead since 11/1/2015:	189

### Children Younger than 6 Years Old

Total number of children tested for lead from 1/1/2013 to 4/14/2014	3811
Number of child BLL test results ≥5µg/dL from 1/1/2013 to 4/14/2014	112
Total number of children tested for lead from 4/15/2014 to 9/30/2015:	4156
Number of child BLL test results ≥5µg/dL from 4/15/2014 to 9/30/2015:	181
Total number of children tested for lead from 10/1/2015 to 10/31/2015:	516
Number of child BLL test results ≥5µg/dL from 10/1/2015 to 10/31/2015:	16
Total number of children tested for lead since 11/1/2015:	75
Number of child BLL test results ≥5µg/dL since 11/1/2015:	3

### Adults (18 Years or Older)

Total number of adults tested for lead from 1/1/2013 to 4/14/2014	170
Number of adult BLL test results ≥5µg/dL from 1/1/2013 to 4/14/2014	22
Total number of adults tested for lead from 4/15/2014 to 9/30/2015:	207
Number of adult BLL test results ≥5µg/dL from 4/15/2014 to 9/30/2015:	13
Total number of adults tested for lead from 10/1/2015 to 10/31/2015:	343
Number of adult BLL test results ≥5µg/dL from 10/1/2015 to 10/31/2015:	6
Total number of adults tested for lead since 11/1/2015:	51
Number of adult BLL test results ≥5µg/dL since 11/1/2015:	3

### Children 6 to 17 Years Old

Total number of children tested for lead from 1/1/2013 to 4/14/2014	676
Number of child BLL test results ≥5µg/dL from 1/1/2013 to 4/14/2014	5
Total number of children tested for lead from 4/15/2014 to 9/30/2015:	654
Number of child BLL test results ≥5µg/dL from 4/15/2014 to 9/30/2015:	7
Total number of children tested for lead from 10/1/2015 to 10/31/2015:	347
Number of child BLL test results ≥5µg/dL from 10/1/2015 to 10/31/2015:	6
Total number of children tested for lead since 11/1/2015:	63
Number of child BLL test results ≥5µg/dL since 11/1/2015:	1

Attached you will find the items I mentioned this morning that were forwarded to the Task Force yesterday.

--A detailed MDHHS Action Plan on Flint Water Public Health

--An overview provided by our Bureau of EMS, Trauma and Preparedness giving further detail on considerations for use of the Incident Command System or Community Health Emergency Coordination Center (CHECC)

--Answers to the lead abatement questions posed to the department from the Task Force.

Thanks--g

**Flint Water Public Health Response: MDHHS Action Plan**  
**Update 11-24-15**

TASK	STATUS	ACTION	DATE COMPLETED
<b>Filter Distribution</b>	Residents may continue to obtain filters from Genesee County Community Action Resource Department (GCCARD) (both sites 9-4PM) and MDHHS clients can continue to obtain filters at the two MDHHS office locations or the GCCARD sites.	Since 10/6, 11,355 MDHHS purchased water filters and 200 water pitchers have been distributed.	<b>Ongoing</b>
<b>Filter Replacement Distribution</b>	The procedure is in place for replacement cartridge distribution including an abbreviated application for residents to apply for and obtain cartridge replacement. Cartridge replacement will occur at same locations as filter sites. DHHS is also placing an order for 750 replacement filters for the 8-cup Zerowater filters. 9000 Brita replacement filters on hand with an additional 10,000 readily available when needed. Total available= 19,000	1,418 MDHHS purchased replacement water filters have been distributed.	<b>Ongoing</b>
	MDHHS is currently coordinating with GCCARD on publicity for distribution of the replacement filters. United Way will provide Pur Filter Replacements. United Way will also be purchasing filter units for school water fountains. Press release planned Monday 11/2 re: pick up of replacement filters, videos to be posted on websites and you tube.	Jen Eisner will work with Hilda McShane	<b>Completed 11/2</b>
	<b>United Way requested that MDHHS purchase Pur filter replacements. GCCARD requests that no more bottled water be donated. They have plenty in stock. Cash is preferred. City of Flint set up distribution point in City Administration office building. Genesee County Health Department (GCHD) will be providing City of Flint with Pur Filters. The Brita filter requires a form for MDHHS be filled out; there are some concerns that undocumented members of population will avoid Brita filters for this reason.</b>	<b>No action indicated.</b>	
<b>Public Education Proper Filter Use</b>	When used improperly, the filters will exceed their capacity limit in a much shorter time frame thereby increasing need for filter replacement much sooner than expected. Develop NEW public education material about proper use of cartridge AND how to obtain filter replacement cartridges, targeted for release week of October 26 during lead awareness week.		<b>Completed</b>

TASK	STATUS	ACTION	DATE COMPLETED
	Request made for written instructions on filter cartridge replacements for nurse case managers to take on home visits. Wes is working to complete a packet for nurse case managers which will include information on filters.		Completed
	Video created by MDHHS with Home Depot demonstrating replacement of the Brita replacement filter. DEQ receiving questions about meters on the water filter pitchers delivered to the schools which are likely Zerowater Filters.	The video added to the gov/flintwater website.	Completed 11/2
	Video will be added to nurse training—Childhood Lead Poisoning Prevention Program (CLPPP).		Completed 11-10
<b>Lead Testing Protocol:</b>	Draft protocol has been completed, undergoing final review. Protocol calls for testing: Priority groups- <ul style="list-style-type: none"> <li>• Confirmatory venous testing for children who had venous testing (115 children)</li> <li>• Children in day care, Head Start</li> <li>• children attending 3 schools (Freeman, Eisenhower, Brownell)</li> <li>• Children residing in high risk zip codes (03, 04)</li> <li>• All other students</li> </ul> Protocol will be announced in a joint MDHHS/GCHD Press release.		Completed 10-28
<b>Blood Lead Testing: 9/28/15-10/23/15</b>	CLPPP processed 580 tests from Flint zip codes since 9-28-15; 5 children were reported with elevated lead blood levels.  There approximately 200 children that have been identified for follow-up.	MDHHS has arranged a contract with the GCHD to provide nurses for the follow-up.	Contract completed in E-grams as of 10-23
	Cross reference list of children with elevated lead levels with filter distribution data to ensure household has a filter. (Peeler/Scott) So far only about 20% of approximately 200 children with EBL are known to have received a filter. GCHD will deliver filters to these homes as they are doing the case follow-up. GCHD will provide weekly updates.	Send list to Kris S (done)	In process
	A group will develop reporting metrics and system to track same: Linda Dykema, Wes Priem, Michele Bruneau, Bob Scott and group met to discuss metrics. Plan to produce first detailed report for internal review the week of Nov. 9 <sup>th</sup> . Additional work on the numbers was required to ensure accuracy. A simplified version for external dissemination will be released after internal review.	Completed	Completed

TASK	STATUS	ACTION	DATE COMPLETED
	Linda Dykema is working on an analysis of blood lead tests done since 9-28-25. Epi will assist with this analysis. Still fine-tuning the report.		
	Draft press release, talking points and BLL report (for period 10/1/15-11/13/15) in progress.		<b>Pending</b>
	Reach out to Medical Services Administration of MDHHS to discuss maximum effort to promote blood lead testing of children 0-6	MDHHS developing strategy to reach out to Medicaid health plans.	Sue Moran, Chris Priest and Kathy Stiffler working on this currently.
<b>Parent education</b>	Parent education material completed. Discuss dissemination of parent material through Flint schools.	Call with Flint school superintendent, GCHD, and MDHHS scheduled 10-26-15 to discuss dissemination process.	<b>Completed</b>
	Schools require 6000+ information packets for distribution to all students. Print order sent to DTMB.  Hardcopy will be distributed to GCHD for issuing to the schools, and to Headstart, daycare, and other agencies in Flint with children ages 0-5. Mark will drop off hard copies at GCHD. Toni LaRocco will take the lead in distribution of the materials to the schools and other agencies.	MDHHS Geralyn Lasher arranged for printing.	<b>Completed.</b> 10/30 printing completed and Mark dropped off 6,000 copies at the Flint School Admin. Building, and 2,500 to health dept. Remainder dropped off on 11/2.
	Ensure legislators receive material in advance	Elizabeth Hertel coordinate legislator notification	<b>Completed</b>

TASK	STATUS	ACTION	DATE COMPLETED
<b>Provider Education</b>	Provider Education material completed. Communication to providers will occur through GCHD and MDHHS networks (GCMS, GCARD, hospitals, etc).MDHHS will distribute through the Medicaid Health Plans. Hurley providers received the packet and the remainder of providers will receive the information next week.	Mark Valacek Wells/Peeler  Electronic dist. through various listservs.	<b>Completed</b> 10/30  <b>Completed 11/2</b>
	A webinar for health care providers will be held in early December to discuss the Lead issue, blood lead testing, Ready to Feed Formula, and answer any questions. It will be co-sponsored by the GCHD medical director.		
<b>Community public education and testing event</b>	McLaren Health Plan in conjunction with GCHD hosted a public testing and awareness event on November 5 at the Burton GCHD site. 40 children were tested. McLaren will have providers on site to perform testing for their members; GCHD onsite to perform testing for all others. Event will also include Medicaid application assistance. Tony Larocco (GCHD) has contacted Molina and Meridian Health Plan regarding sponsorship of community testing and awareness event. Molina and Meridian Health Plan testing dates to be determined. GCHD will be at a community event on Nov. 12, from 2 PM to 7 PM, to focus on testing for children 0-5. (Brownell and Holmes Schools)> Another testing event was held at Brownell School on 11/12. Many organizations were present to provide information and services. 27 children were tested, 60 filters distributed. <b><u>There was only one EBL result from the Brownell clinic (5.5 ppb that will be reported out as a 6.0; McLaren results are not available yet.) Flint schools superintendent is interested in having another event.</u></b>	Dr. Forschee has been contacted. Tony contacted Molina and there is interest in a future testing event.	<b>Pending</b>
	There will be a combination school testing/townhall/education event, sponsored by Rep. Neeley, on Nov. 2 <sup>nd</sup> . A telephonic townhall is slated for Oct. 28 by Rep. Neely. Gongwer reported that 4,000 people participated in this call.	FYI	<b>Completed</b>
<b>Public Education Materials</b>	Mark Johnson, is the regional representative for ASTDR and CDC. He has been designated as contact. A call was held with ATSRDR on 11/13 to discuss how to improve outreach efforts to the Flint community about lead hazards. It was suggested that state/county consider lowering the readability level of the lead materials for the public to 3 <sup>rd</sup> or 4 <sup>th</sup> grade	CLPPP and GCHD staff will review documents and work with the communication	<b>Pending</b>

TASK	STATUS	ACTION	DATE COMPLETED
	reading level. <u>A workgroup is currently reviewing the documents for needed changes. Jim Henry contacted Dr. Suzanne Selig (UMichigan-Flint School of Public Health) who will seek community feedback on the materials that have been developed. After readability changes, some of the materials will be translated into Spanish and Arabic.</u>	office on any changes.	
<b>Environmental Investigation</b>	<p>MDHHS requested a \$275,000 contract with ETC on Oct. 21<sup>st</sup>, 2015. About 275 EBL investigations are budgeted for Flint. Wes Priem will work with GCHD to coordinate with Flint Housing/other authorities to deal with recalcitrant landlords.</p> <p>MDHHS Division of Environmental Health (DEH) meeting on 11/5 with MDEQ staff to harmonize EBL investigation protocol with water testing protocol. 11/12 The EBL contractor met with GCHD staff to coordinate activities with case management. <u>The EBL investigation activities require a substantial amount of time (4 hours), less than that for the case management activities; however, the team is arranging joint visits where possible.</u></p>		<b>Contract completed 10/29</b>
<b>Nurse Follow Up</b>	<p>Project sent to Contracts for inclusion in E-grams 10-23-15. 10-21-15 Funding for case management nurses will be disseminated to GCHD through new project: <i>Flint Water</i>, for \$425,000 through the Comprehensive Contract E-grams system, to fund the: Follow-up of Children Reported with Elevated Lead Levels: Case Management Services. GCHD advised to secure approvals for use of these funds and begin procedures to place staff in appropriate positions to conduct the work.</p> <p>GCHD has shifted one nurse over for follow-up. That nurse is fully trained on elevated lead patient management. 1.5 nurse FTE's will be assigned and trained on 11-10-15.</p> <p>Lead Safe Home Program worked with GCHD on protocol to harmonize the flow of outreach to families with children with elevated blood levels. 11/10 Training has been completed for 2.5 FTE nurses. Some follow-up training will be scheduled as well. <u>Follow-up training with nurses was completed on 11-17. Weekly calls have been set up with CLPPP staff and nurses.</u></p> <p><u>Weekly status report from GCHD attached in separate file.</u></p>	Eden will contact Bob to send the list to Toni at GCHD so they can facilitate case management of children with elevated lead levels (done). Contract approved 10/26	<p><b>Completed 10/27</b></p> <p><b>Completed 11-10</b></p>
<b>Water Testing</b>	DEQ will be testing at Freeman Elementary the week of 10-26-15, with plans to expand to	No action	

TASK	STATUS	ACTION	DATE COMPLETED
	<p>14 schools. Residential testing will have a different protocol. GCHD has been in contact with DEQ to possibly assist in sampling.</p> <p>Linda Dykema has a draft Executive Summary for Health-Based Drinking Water Lead Levels developed. Once testing is completed, this document will serve as a decision guide on reopening of school and/or daycare water fountains/faucets for student use. Linda will revise the model to include paint chip values/risk levels. GCHD sanitarians are assisting DEQ with water sampling. We should anticipate some differences in opinion on actionable pb levels.</p> <p>Suggested that the following language that DC used be adapted for our use: “The removal of lead in drinking water is most effective if the full lead service line is removed from both the public and private property. If you choose not to replace your private side pipe, lead can continue to dissolve in your drinking water. You should also replace galvanized plumbing, older lead soldered pipes, and brass fixtures and use a different plumbing material in your home. Until all potential sources of lead in drinking water are removed from your private property, be sure to follow the flushing and filter instructions provided.”</p> <p>“Water is lead-free when it leaves the treatment plant, but lead can be released when the water comes in contact with pipes and plumbing fixtures that contain lead. Lead sources and lead levels vary between buildings, so it is important to identify and remove any lead sources in each household.”</p> <p>“Pregnant or nursing women and children under age six should use filtered tap water for drinking water and cooking until all lead sources are removed. Filters certified for lead removal are required to meet National Sanitary Foundation (NSF) Standard 53.”</p> <p><b><u>This language will be incorporated into EBL investigation reports and in the educational packets the nurses will distribute.</u></b></p>	indicated, informational only – DEQ.	Pending
Misc.	<p>City of Flint is asking when the county will lift the emergency order. Jim Henry from GCHD mentioned he was hearing some concerns raised again about Legionella. Eden said that Jim Collins can help address this. Mark V. said that an extensive data analysis was done on this previously and it isn’t an issue.</p> <p>DEQ gave permission to increase phosphate levels in the water temporarily. Some health concerns might be raised about this particularly for infants. Dr. Eden Wells said that it is unlikely to cause health problems but we can add information on the FAQ to help reassure</p>		

TASK	STATUS	ACTION	DATE COMPLETED
	<p>citizens.</p> <p>DEQ released its Freeman School water testing results this week. EPA released its report from its expedited review of the response as well.</p> <p><b><u>The water testing protocol has been changed to no longer do pre-flushing of the pipes. Other schools that are interested in having their water tested should make a request to DEQ. LARA will do a plumbing assessment before the water samples are taken.</u></b></p> <p>The City of Flint is considering taking over the cost of providing the replacement pipes for at least some of the high risk homes.</p>	FYI only	
	<p>A call was held on the 10<sup>th</sup> with MDHHS staff and the regional USDA staff and congressional staff, on the ready to feed formula issue. Both USDA and Sen. Stabenow's office satisfied with client communication and monitoring process in place. Talking points have been developed by WIC staff and sent to the communication office for review.</p> <p>The talking points have been approved by the Communications Office. There has only been one client request for Ready to Feed formula in the Flint WIC clinic.</p> <p>There will be a farmers market, in conjunction with a flu clinic, that the GCHD is holding on 21 November and lead-related information will be provided by GCHD.</p>	FYI	<p><b>Completed</b></p> <p><b>Pending</b></p>
	Internal calls will be held once a week on Thursdays at 12:30.	FYI	<b>Ongoing</b>

# **BUREAU OF EMS, TRAUMA AND PREPAREDNESS**

## **Considerations for Use of the Incident Command System (ICS) for the Flint Lead Contamination Incident November 24, 2015**

### **Basic ICS tenets:**

- Activation of Incident Command System (ICS) is determined by the scope and magnitude of an incident.
- Commonalities in all incidents include acute harm to the environment, infrastructure or populace by an agent such as biological, toxin/poisons, or natural causes (severe weather is most common).
- The first step is determining the scope & magnitude of the incident with a preliminary assessment. This assessment determines if ICS is appropriate for the response and what the response should be for the mitigation or containment of the causative agent to minimize negative effects on the environment or public.
- Following the initial acute response phase, there is both short term and long term recovery. In this situation, this could include identification of exposed children, lead testing & treatment if appropriate and monitoring of that vulnerable population for negative health consequences in subsequent years.

### **Unified Command:**

- This is the ICS method of best efficacy for incidents involving multiple jurisdictions or agencies.
- Enables institutions and agencies with different legal, geographic, and functional responsibilities to coordinate, plan, and interact effectively.
- The Incident Commanders within the Unified Command make joint decisions and speak as one voice. Any differences are worked out within the Unified Command. Unity of command is maintained. Each responder reports to a single supervisor within his or her area of expertise.
- An example of a Unified Command incident in Michigan is the response to the Enbridge Oil Spill. The command structure included federal, state and local staffing.
- Benefits of a unified approach are:
  - A shared understanding of priorities and restrictions.
  - A single set of incident objectives, planning process and incident action plan.
  - Collaborative strategies.
  - Improved internal and external information flow.
  - Less duplication of efforts.
  - Better resource utilization.

In Michigan, Emergency Management (EM) has ICS command & control of an incident. This is true whether it is local emergency management isolated to one jurisdiction or the MSP Emergency Management and Homeland Security Division for a multi-jurisdictional (3 or more) incident. Most emergencies occur first locally and therefore are under the authority of the local EM and county administration to determine the scope of the incident for utilization of the ICS structure and/or request assistance from the state. All other agencies, health, environmental, & agriculture, etc. are supporting agencies to the EM command and therefore coordinate their own resources for response.

The Michigan Department of Health and Human Services (MDHHS) Community Health Emergency Coordination Center (CHECC) functions within the Multiagency Coordination System (MACS) of the National Incident Management System (NIMS). The CHECC provides coordination and support for the command structure but does not function in a command role. Multiagency coordination is a process that allows different disciplines to work together more effectively. For the CHECC it includes essentially all of public health & healthcare (human services under development).

The primary benefits of the CHECC are during response for coordination of department resources to:

- Establish and clarify policy with the Executive Group.
- Perform a situational assessment
- Establish a health common operating picture.
- Set state level public health & healthcare priorities.
- Facilitate logistics support and resource allocation.
- Interagency activities.
- Synchronize health messaging to ensure that we are speaking with one voice.

### **Long Term Recovery Planning:**

The Flint lead contamination incident is now in response including short term recovery and rapidly transitioning towards long term recovery. Long term recovery could entail community public works redevelopment and revitalization. It presents opportunities to restructure the community and simultaneously making it more resilient with determination of lead-vulnerable pediatric populations. The recovery process involves cooperation of the local agencies, the private sector and non-governmental organizations (such as volunteer organizations, civic organizations, healthcare, and the private sector) and the state. The Flint plan for recovery should outline the basic framework under which the various recovery agencies will operate, leaving the specific and detailed actions to each agency or organization to implement based on the recovery needs of the community and their regulatory authority, fiscal and other resources. This plan could be developed using a Unified Command structure under the direction of the local jurisdiction.

### **Conclusion:**

There are many benefits to the ICS structure for all hazards emergencies. However, utilizing the CHECC at the current stage of this incident without a local ICS structure would appear to be more controlling than coordinating and could have negative outcomes. The deficits in this incident appear to be too many agencies working in silos and a lack of routine, consistent communications horizontally and vertically. A local Unified Command structure could still be implemented to correct these issues.

The CHECC is not required for the state-level assistance that is already being provided by the Michigan Department of Health and Human Services, the Chief Medical Executive, Childhood Lead Poisoning Prevention Program, Environmental Epidemiology and other staff. State level emergency management (SEOC) has not stepped into an operational role in the incident and the CHECC normally follows as support to that command lead. All staffs in the bureau/administration/department however are available to provide technical assistance to public health and healthcare when requested without an ICS structure. If a special team of subject matter experts needs to be assigned it is part of the daily operations and planning (for example with public health investigations of disease outbreaks) used to assist our partners across the state.

The MDHHS Action Plan for the Flint Water Public Health Response, demonstrates the numerous areas where the department is directly involved with federal, state and local partners and itemizes the issues that are being addressed. MDHHS can easily increase the frequency of the Action Plan updates to better ensure appropriate communication of activities with partners such as the Governor's Task Force on Flint Water Issues, the DEQ, the Genesee County Health Department, and others.

**Michigan Department of Health and Human Services  
Governor's Task Force on Flint Water follow up on lead abatement funding questions**

**What is total funding availability for lead abatement- please list by source?**

Current abatement funding available is for abatement of lead-based paint hazards only by federal definition and does not include funding for water remediation.

Currently, the Division of Environmental Health, Healthy Homes Section has **\$1,239,761 in state General Funds** and **approximately \$450,000 in U. S. Department of Housing and Urban Development (HUD) funds** for lead-based paint hazard abatement for Fiscal Year 2016.

The Healthy Homes Section identified 10 target areas throughout the state for this funding based on number of children with elevated lead levels and amount of pre-1978 housing stock to receive priority for this funding. Genesee County is included as a designated target area. Also included as a target area is Kent County and the City of Grand Rapids as they were not awarded HUD funding during this round.

**Amount of HUD funding that GCHD could have applied for had they chosen to do so?**

In FY 2015, HUD made available lead-based paint hazard control funding in which agencies could apply for up to \$3,325,000 (3 year funding round) for lead hazard abatement. The MDHHS, Healthy Homes Section applied and received \$3,231,610 in HUD funds in FY 2015. The Genesee County Health Department and/or the City of Flint did not apply.

**How much of the lead abatement funding has historically gone to Genesee County? Wayne County? City of Flint?**

**Federal**

Data from HUD indicates:

**City of Flint**

No grants awarded.

No history of grants applied for through HUD.

**Genesee County**

2009            \$2,070,000

Applied for grant in 2012, not awarded

Applied for grant in 2014, not awarded

**Wayne County (excludes City of Detroit)**

1997	\$4,994,424
2007	\$3,000,000
2012	\$2,480,000

Applied for grant in 2009, not awarded

Applied for grant in 2010, not awarded

Applied for grant in 2011, not awarded

**City of Detroit**

1995	\$5,917,839
2002	\$2,160,000
2004	\$4,000,000
2006	\$3,996,680
2009	\$3,535,372
2014	\$3,637,000

**State**

Through the Healthy Homes Section, Lead Safe Home Program, since inception of the program in 1997:

**Genesee County/City of Flint**

Approximately \$1,330,688 has been used to abate lead-based paint hazards in approximately 224 homes located in Genesee County, with \$1,183,503 (approximately 203 homes) of this funding going directly to homes located in the City of Flint.

**Wayne County**

Approximately \$3,175,249 has been used to abate lead-based paint hazards in approximately 528 homes located in Wayne County, with \$2,735,645 (approximately 448 homes) of this funding going directly to homes located in the City of Detroit.

**How many homes in city of Flint abated in FY 15? Any homes abated thus far in FY 2016?**

Through the MDHHS Lead Safe Home Program, of the 177 homes abated statewide in Fiscal Year 2015, nine were projects located within the City of Flint. In addition, there are currently three enrolled properties within the City of Flint to date in Fiscal Year 2016.

Genesee County and/or the City of Flint did not apply for HUD funding in Fiscal Year 2015 and therefore does not currently have their own funding available for lead-based paint hazard abatement.

**Subject:** Talking points

Talking Points:

- <!--[if !supportLists]--><!--[endif]-->Rates of positive lead tests (greater than or equal to 5 mcg/dl) vary over time partly due to small numbers and seasonal fluctuation.
- <!--[if !supportLists]--><!--[endif]-->Shortly after the 2010 quarters rates were below the state 5 year average in most Flint zip codes.
- <!--[if !supportLists]--><!--[endif]-->Beginning in Quarter 3 of 2014 rates increased in all Flint zip codes except 48507
- <!--[if !supportLists]--><!--[endif]-->In Q1 2015 rates decreased, but begin rising and are highest in Q3 of 2015 in zip codes 48503 and 48504.
- <!--[if !supportLists]--><!--[endif]-->Data for Q4 2015 is incomplete and based on tests drawn after October 1, with results reported to and processed in the MDHHS data warehouse. Data from this quarter should not be used for comparison until the quarter is complete.

Childhood Lead Testing Reporting –weekly, quarterly and cumulative analysis technical specifications.

### **Case Definitions**

Child or Adult tested - The number of unduplicated individuals whose blood lead level was reported via either the lab or the provider to the MDHHS lead program and uploaded into the MDHHS data warehouse.

Age groups were sub-categorized as:

1. Children ages 0 through 5 years of age
2. Children ages 6 through 17 years of age.
3. Adults age 18 years and older.

Elevated blood lead level - Blood lead result  $\geq 5$ mcg/dl

Test results sub-categories as defined by the American Academy of Pediatrics:

1. < 5 mcg/dl
2. 5-14 mcg/dl
3. 15-44 mcg/dl
4. > 44 mcg/dl

Test results are the highest test reported, either venous or capillary.

Time frame is based on the Specimen Date

The average interval between Specimen Date and Report Date (upload into the data warehouse) is 12.4 days, so we need at least 2 weeks for the data to settle. However, when we extracted the sample using report date, we found records with specimen dates' from 2012-2014. Thus we are using specimen date to extract the data.

Place: Based on Patient Zip and limited to zip codes 48501 to 48507.

Other

Deduplicated to time period retaining highest venous test or capillary if no venous.

Purpose is to identify children tested during the time frame.

Additional analyses are needed to better understand how results are received and processed in the data warehouse (we are finding true duplicates, duplicates reported on subsequent report dates, long interval between specimen date and report date, and we aren't finding as many children receiving follow-up testing as we would expect, but may need to lengthen our time frame to look for them).

Talking Points:

- Rates of positive lead tests (greater than or equal to 5 mcg/dl) vary over time partly due to small numbers and seasonal fluctuation.
- Shortly after the 2010 quarters rates were below the state 5 year average in most Flint zip codes.
- Beginning in Quarter 3 of 2014 rates increased in all Flint zip codes except 48507
- In Q1 2015 rates decreased, but begin rising and are highest in Q3 of 2015 in zip codes 48503 and 48504.
- Data for Q4 2015 is incomplete and based on tests drawn after October 1, with results reported to and processed in the MDHHS data warehouse. Data from this quarter should not be used for comparison until the quarter is complete.

**MICHIGAN DEPARTMENT OF HEALTH AND HUMAN SERVICES (MDHHS)**  
**SUMMARY OF BLOOD LEAD LEVEL TEST RESULTS FOR FLINT ZIP CODES 48501-48507**  
**AS OF OCTOBER 30, 2015**

**Executive Summary**

This report is generated by MDHHS to track Blood Lead Level test results in Flint, Michigan.

- Counts on this report include both capillary and venous blood tests. People who have had multiple tests are counted only once.
- Since 10/1/2015, an additional 963 people have been tested in Flint.
- Continued testing efforts by Genessee County Health Department, MDHHS and local medical personnel have identified 18 children with blood lead levels greater than or equal to 5ug/dL since 10/1/2015.
- 3% of the children younger than 6 years old tested since 10/1/2015 have had blood lead levels greater than or equal to 5ug/dL.
- Additional testing is ongoing. Counts may vary slightly as new results are added.

**Number of People Tested for Lead in Flint**

Total number of people tested for lead from 4/15/2014 to 9/30/2015	5017
Total number of people tested for lead since 10/1/2015:	963

**Children Younger than 6 Years Old with Blood Lead Levels (BLL)  $\geq$ 5ug/dL**

Total number of children tested for lead from 4/15/2014 to 9/30/2015:	4156
Number of child BLL test results $\geq$ 5ug/dL from 4/15/2014 to 9/30/2015:	181
Total number of children tested for lead since 10/1/2015:	385
Number of child BLL test results $\geq$ 5ug/dL since 10/1/2015:	12

**Adults with Blood Lead Levels (BLL)  $\geq$ 5ug/dL**

Total number of adults tested for lead from 4/15/2014 to 9/30/2015:	207
Number of adult BLL test results $\geq$ 5ug/dL from 4/15/2014 to 9/30/2015:	13
Total number of adults tested for lead since 10/1/2015:	289
Number of adult BLL test results $\geq$ 5ug/dL since 10/1/2015:	6

**Children 6 to 18 Years Old with Blood Lead Levels (BLL)  $\geq$ 5ug/dL**

Total number of children tested for lead from 4/15/2014 to 9/30/2015:	654
Number of child BLL test results $\geq$ 5ug/dL from 4/15/2014 to 9/30/2015:	7
Total number of children tested for lead since 10/1/2015:	289
Number of child BLL test results $\geq$ 5ug/dL since 10/1/2015:	6

**Subject:** Summary Data

This afternoon at 2:30 p.m., the Michigan Department of Health and Human Services will issue the attached press release and summary report detailing the latest data on blood lead levels in Flint.

We wanted to ensure that the Genesee County Health Department received this information in advance of the press release being issued.

The summary report provides annual historical information on children younger than six years, children between the ages of six and seventeen years and adults tested for lead. It also provides detail on the number of test results for these category groups that have tested above five micrograms per deciliter. The summary report also provides information on the numbers tested and with elevated blood lead levels since the MDHHS Action Plan began in October.

The preliminary data indicates that 30 of 1,361 adults and children tested in Flint since October 1 had elevated blood lead levels.

Thank you,  
Geraldyn

**MDHHS releases latest data outlining blood lead levels in Flint**  
*Follow-up care, case management resources continue for families*

LANSING, Mich. – Preliminary data indicates that 30 of 1,361 adults and children tested in Flint since October 1 had elevated blood lead levels, according to a report issued today by the Michigan Department of Health and Human Services.

This marks the first summary report on lead testing called for in the state's action plan related to health concerns about Flint's water infrastructure.

"Our goal is to help families reduce their exposure to lead sources," said Dr. Eden Wells, MDHHS chief medical executive. "We have made progress in testing and identifying those with elevated blood lead levels, and the department will continue to work closely with the Genesee County Health Department to reach these families. We will remain diligent in our ongoing outreach and education efforts."

Information comes from tests administered citywide to 1,361 children and adults since October 1. Tests showed that 21 of 969 children age 17 or younger and 9 of 392 adults over the age 18 were identified with elevated blood lead levels.

The report covers test results reported to MDHHS since the state action plan was put in place Oct. 2. It includes the number of tests and number of elevated blood lead levels greater than 5 micrograms per deciliter, and captures both capillary and venous blood tests that have been reported to MDHHS since the beginning of October. People who have had multiple tests are counted only once. Five micrograms per deciliter is the level that the Centers for Disease Control and Prevention considers elevated and triggers health care professional follow up with families.

The full report is posted online at [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater) and will be updated as more data becomes available.

When reviewing historical trend data, the risk of lead exposure is highest during the third quarter of each year – July through September. Seasonal variation is the result of a number of factors including increased exposure to lead in dust and soil in the summer months.

In the third quarter of 2010, 8.3 percent of Flint children 6 and under showed elevated blood lead levels. The figure gradually decreased to 4.1 percent in the third quarter of 2013. During the same months in 2014, the figure increased to 7.5 percent and decreased to 6.4 percent in the third quarter of 2015.

– MORE –

Last month, MDHHS collaborated with the county health department and local partners to distribute educational resources and informational letters to Flint parents regarding lead testing. The state is providing funding for GCHD nurses to work with families when an elevated blood lead level has been detected. During these follow-up visits, nurses coordinate with environmental health investigators to meet with families in their homes to identify lead exposures, address questions and provide water filters. People can be exposed to lead from paint, soil, plumbing and other sources.

MDHHS continues to provide free water filters and replacement cartridges to Flint residents at four locations, including the MDHHS Flint offices and the Genesee County Community Action Resource Department. For a full list of locations and hours of distribution, visit [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater).

To help residents properly install water filters, and to demonstrate how to replace the original when it expires, MDHHS has created an instructional video on its [YouTube channel](#). For updates, visit [www.michigan.gov/flintwater](http://www.michigan.gov/flintwater).

## Blood Lead Level Test Results for Flint Zip Codes 48501-48507

### Genesee County, and the State of Michigan

#### Summary as of November 13, 2015

#### Executive Summary

This report is generated by MDHHS to track Blood Lead Level test results in Flint, Michigan.

- Counts on this report include both capillary and venous blood tests. People who have had multiple tests are counted only once per year.
- Since 10/1/2015, an additional 1,361 people have been tested in Flint.
- Continued testing efforts by Genesee County Health Department, MDHHS and local medical personnel have identified 21 children with blood lead levels greater than or equal to 5µg/dL (micrograms per deciliter) since 10/1/2015.
- Three percent of the children younger than 6 years old tested since 10/1/2015 have had blood lead levels greater than or equal to 5µg/dL.
- Additional testing is ongoing. Counts will vary as new results are added.

Incidence of elevated blood lead  $\geq 5$  mcg/dl among children  $< 6$  years of age by quarter, 2010- 2015

Deduplicated by year, retains test during the time period.

\*Data for Q4 2015 are incomplete

\* Data for Quarter 4 of 2015 are incomplete and subject to change

Good morning, Nancy!

Please respond to me on this with a CC to Rashmi and Sue Moran. I have the heat map from last week, but he wants the numbers as well---

Good morning,

I will get information right away to CLPP on this- but there are established protocols, and they do involve the primary care provider as well. I have a heat map showing the numbers of children above 5 and 15 by zip, so I know we have those numbers as well. To you shortly,

E

On Mon, Oct 5, 2015 at 8:52 AM, Lyon, Nick (DHHS) <[LyonN2@michigan.gov](mailto:LyonN2@michigan.gov)> wrote:

So, I have a process question: If a child tests above 5 micg/dl, the suggested protocol is to provide information on how to mitigate lead exposure in the home and do a follow up blood test in the future. Can someone describe the protocols/requirements that are supposed to be followed and who is doing it?

I am also curious to know how we've done with children who have a confirmed elevated blood level. If I look at the zip code data we were using last week, there have been more than 100

children who have tested at 5 or above from 2014 Q3 – 2015 Q2. How many of those children have been retested and what is their result?

I would also like to know summary level data for these zip codes for how many children have tested above .14, and what the follow up rates have been for them as well.

I think this would and should be the next question that we are receiving... You identified the issue, you are suggesting a test, filter, flush approach... what about the kids who tested above the threshold?

Nick

<Blood Lead Level (BLL) Quick Reference for Primary Care Providers.pdf>

<Lead Program Process Map 1.27.15.pptx>

<AAP Medical Management of Childhood Lead Exposure-June-2013.pdf>

<DRAFT Response to N.Lyon 10.5.15.docx>

## **If a child tests above 5 mcg/dL –**

- Both Medicaid and the MDHHS Childhood Lead Poisoning Prevention Program (CLPPP) have adopted the Recommendations on Medical Management of Childhood Lead Exposure and Poisoning provided by the American Academy of Pediatrics (AAP) Pediatric Environmental Health Specialty Unit. These recommendations lay out the steps and activities for a **Primary Care Provider (PCP)** once a child has an elevated blood lead level.
  - Medicaid has integrated these Recommendations into the Medicaid Provider Manual.
  - CLPPP has developed a Quick Reference for Primary Care Providers that summarizes the same recommendations (attached, and also available on the home page of the program website, [www.michigan.gov/lead](http://www.michigan.gov/lead)).
  - The PCP should:
    - Review the test results with the family
    - If original test was a capillary sample, confirm results with venous sample
    - Provide anticipatory guidance
    - Review environmental history, including other children who may be exposed
    - Provide nutrition counseling and monitor development
    - Refer for case management
    - Re-test every 1-3 months
    - IF level >44, consult with experts (Children's Hospital of Michigan)
- The AAP document also suggests that the PCP refer the patient to local health authorities if such resources are available.

## **What we've done for children who have a confirmed elevated blood lead levels (EBL).**

- Per Public Health code, CLPPP sends weekly data to each local health department, listing all new lead tests for children in that jurisdiction (see attached Process Map).
- Lead follow-up services are NOT a mandated service; Local Public Health (LPH) agencies are not mandated provide any kind of follow-up services or even open the CLPPP data files. Each agency chooses whether to respond, and what kind of response they want to make.
- LPH can bill Medicaid on a fee-for-services basis for lead testing, for 2 nursing assessment visits, and for 1-2 environmental investigation visits. However, health departments find that the reimbursement rate does not cover their cost of providing these services.
- The requested data for FY2014 Q3 – FY2015 Q2 regarding follow-up testing is attached.
  - We assumed that the request was referencing quarters based on the fiscal year to capture the timeframe after the change in water source (not quarters based on calendar year).
  - For the 43 children with levels of 5-14 mcg/dL, 14 (32.5%) were retested. One had a level that rose above 15 mcg/dL, the other 10 stayed in the same range or dropped below 5 mcg/dL.

- For the 3 children with a level >15 mcg/dL, one (33%) was retested, and that child's level has stayed above 15 mcg/dL.
- There were another 71 children that had initial capillary tests showing a level of 5 mcg/dL or above; only 15 (21%) have had the required confirmatory venous test. The single child with the highest level (> 15 mcg/dL) did not have a confirmatory venous test.
- For those with initial capillary tests that received a follow-up venous test, 7 had a level that dropped below 5 mcg/dL; 7 fell in the 5-14 mcg/dL range; and one was > 15 mcg/dL.

## Next steps/in process

- The Medicaid Health Plan re-bid included the requirement that plans provide Care Coordination for every enrolled child with a blood lead level >5.
- CLPPP is working with Medicaid to determine best approaches for:
  - Providing weekly data files to support these new care coordination services.
  - Developing the process and identifying payment strategies to establish a pool of trained and certified providers in each community that the health plans can refer to who will provide follow-up health-related services to families in their homes.
  - These providers could include a Community Health Worker, may be a Nurse, still TBD. This could include LPH, but would need to include other potential providers to cover communities where LPH chooses not to provide any to lead follow-up services.
- The Healthy Homes Section is participating in these conversations, relative to the EBL investigations that are necessary, however there currently appear to be fewer options for addressing issues around funding and providing the EBL investigations.
- In addition, CLPPP currently provides Prevention grants to 10 communities, including Genesee County. We use a data-drive process to identify the communities with the highest number of children with elevated blood lead levels in the range of 5-14 mcg/dL. The Genesee County grant, for \$7,500, is focused specifically on Flint. The grant provides resources to support the local health department to conduct prevention activities in homes of families with children with blood lead levels 5 to 14 mcg/dL, and in homes of pregnant women enrolled in Medicaid living in homes built before 1960 (the current contract says levels of 5 to 9, and we are fixing this to read 5 to 14). We anticipate that these grants could end after this fiscal year, depending on how the system might be re-shaped based on the health plan bids.
- CLPPP also funds Education & Outreach grants, organized by Prosperity Region. St. Clair Public Health currently holds the grant to provide Education to stakeholders in Region 6 (\$20,000), which includes Genesee County. They provide training and materials to health care providers, child care providers, public schools, owners and tenants of residential dwellings, and parents of young children.

## Follow-up for Children in Flint (ZIPs 48501-48507) with Elevated Blood Lead Levels April 2014 through March 2015

### Children with Initial Confirmed (Venous) Elevated BLL 5-14

Children w/BLL 5-14:	43
With retest:	14
Most recent retest was <5:	4
5 to 14:	9
>= 15:	1

### Children with Initial Confirmed (Venous) Elevated BLL >= 15

Children w/BLL >= 15:	3
With retest:	1
Most recent retest was <5:	0
5 to 14:	0
>= 15:	1

---

### Children with Initial Capillary Elevated BLL 5-14 (needing confirmation)

Children w/BLL 5-14:	70
With confirmatory venous:	15
Confirmatory test was <5:	7
5 to 14:	7
>= 15:	1

### Children with Initial Capillary Elevated BLL >= 15 (needing confirmation)

Children w/BLL >= 15:	1
With confirmatory venous:	0

## Recommendations on Medical Management of Childhood Lead Exposure and Poisoning

No level of lead in the blood is safe. In 2012, the CDC established a new “reference value” for blood lead levels (5 mcg/dL), thereby lowering the level at which evaluation and intervention are recommended (CDC).

Lead level	Recommendation
<b>&lt; 5 mcg/dL</b>	<ol style="list-style-type: none"> <li>1. Review lab results with family. For reference, the geometric mean blood lead level for children 1-5 years old is less than 2 mcg/dL .</li> <li>2. Repeat the blood lead level in 6-12 months if the child is at high risk or risk changes during the timeframe. Ensure levels are done at 1 and 2 years of age.</li> <li>3. For children screened at age &lt; 12 months, consider retesting in 3-6 months as lead exposure may increase as mobility increases.</li> <li>4. Perform routine health maintenance including assessment of nutrition, physical and mental development, as well as iron deficiency risk factors.</li> <li>5. Provide anticipatory guidance on common sources of environmental lead exposure: paint in homes built prior to 1978, soil near roadways or other sources of lead, take-home exposures related to adult occupations, imported spices, cosmetics, folk remedies, and cookware.</li> </ol>
<b>5-14 mcg/dL</b>	<ol style="list-style-type: none"> <li>1. Perform steps as described above for levels &lt; 5 mcg/dL.</li> <li>2. Re-test venous blood lead level within 1-3 months to ensure the lead level is not rising. If it is stable or decreasing, retest the blood lead level in 3 months. Refer patient to local health authorities if such resources are available. Most states require elevated blood lead levels be reported to the state health department. Contact the CDC at 800-CDC-INFO (800-232-4636) or the National Lead Information Center at 800-424-LEAD (5323) for resources regarding lead poisoning prevention and local childhood lead poisoning prevention programs.</li> <li>3. Take a careful environmental history to identify potential sources of exposures (see #5 above) and provide preliminary advice about reducing/eliminating exposures. Take care to consider other children who may be exposed.</li> <li>4. Provide nutritional counseling related to calcium and iron. In addition, recommend having a fruit at every meal as iron absorption quadruples when taken with Vitamin C-containing foods. Encourage the consumption of iron-enriched foods (e.g., cereals, meats). Some children may be eligible for Special Supplemental Nutrition Program for Women, Infants and Child (WIC) or other nutritional counseling.</li> <li>5. Ensure iron sufficiency with adequate laboratory testing (CBC, Ferritin, CRP) and treatment per AAP guidelines. Consider starting a multivitamin with iron.</li> <li>6. Perform structured developmental screening evaluations at child health maintenance visits, as lead's effect on development may manifest over years.</li> </ol>
<b>15-44 mcg/dL</b>	<ol style="list-style-type: none"> <li>1. Perform steps as described above for levels 5-14 mcg/dL.</li> <li>2. Confirm the blood lead level with repeat venous sample within 1 to 4 weeks.</li> <li>3. Additional, specific evaluation of the child, such as abdominal x-ray should be considered based on the environmental investigation and history (e.g., pica for paint chips, mouthing behaviors). Gut decontamination may be considered if leaded foreign bodies are visualized on x-ray. Any treatment for blood lead levels in this range should be done in consultation with an expert. Contact local PEHSU or PCC for guidance; see resources on back for contact information.</li> </ol>
<b>&gt;44 mcg/dL</b>	<ol style="list-style-type: none"> <li>1. Follow guidance for BLL 15-44 mcg/dL as listed above.</li> <li>2. Confirm the blood lead level with repeat venous lead level within 48 hours.</li> <li>3. Consider hospitalization and/or chelation therapy (managed with the assistance of an experienced provider). Safety of the home with respect to lead hazards, isolation of the lead source, family social situation, and chronicity of the exposure are factors that may influence management. Contact your regional PEHSU or PCC for assistance; see resources on back for contact information.</li> </ol>

## Recommendations on Medical Management of Childhood Lead Exposure and Poisoning

### Principles of Lead Exposure in Children

- A child's blood lead concentration depends on their environment, habits, and nutritional status. Each of these can influence lead absorption. Children with differing habits or nutritional status but who live in the same environment can vary on blood lead concentration. Further, as children age or change residences, habits or environments change creating or reducing lead exposure potential.
- While clinically evident effects such as anemia, abdominal pain, nephropathy, and encephalopathy are seen at levels >40 µg/dL, even levels below 10 µg/dL are associated with subclinical effects such as inattention and hyperactivity, and decreased cognitive function. Levels above 100 µg/dL may result in fatal cerebral edema.
- Lead exposure can be viewed as a lifelong exposure, even after blood lead levels decline. Bone acts as a reservoir for lead over an individual's lifetime. Childhood lead exposure has potential consequences for adult health and is linked to hypertension, renal insufficiency, and increased cardiovascular-related mortality.
- Since lead shares common absorptive mechanisms with iron, calcium, and zinc, nutritional deficiencies in these minerals promotes lead absorption. Acting synergistically with lead, deficiencies in these minerals can also worsen lead-related neurotoxicity.

### Principles of Lead Screening

- Lead screening is typically performed with a capillary specimen obtained by a finger prick with blood blotted onto a testing paper. Testing in this manner requires that the skin surface be clean; false positives are common. Therefore, elevated capillary blood lead levels should be followed by venipuncture testing to confirm the blood lead level. In cases where the capillary specimen demonstrates an elevated lead level but the follow-up venipuncture does not, it is important to recognize that the child may live in a lead-contaminated environment that resulted in contamination of the finger tip. Efforts should be made to identify and eliminate the source of lead in these cases. Where feasible, lead screening should be performed by venipuncture.

### Principles of Iron Deficiency Screening

- The iron deficiency state enhances absorption of ingested lead.
- Hemoglobin is a lagging indicator of iron deficiency and only 40% of children with anemia are iron deficient.
- Lead exposed children ( $\geq 5$  mcg/dL) are at risk for iron deficiency and should be screened using CBC, Ferritin, and CRP. Alternatively, reticulocyte hemoglobin can be used, if available.
- Children with iron deficiency, with or without anemia, should be treated with iron supplementation.

(June 2013 update)

# CHILDHOOD LEAD POISONING

## Blood Lead Level (BLL) Quick Reference for Primary Care Providers

### Not Yet Tested

Consider screening ALL children between ages 1-6

Need for testing can be based on risk factors

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

### BLL <5

Review lead levels with family

Provide anticipatory guidance

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

### BLL 5-14

Review lead levels with family

Confirm results with venous blood sample

Review venous sample with family

Perform environmental history. Consider other children who may be exposed

Consider iron sufficiency, provide nutritional counseling r/t calcium and iron

Provide anticipatory guidance

Refer to case management

**FOLLOW UP:** Retest venous sample within 1-3 months to ensure BLL is not rising

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

### BLL 15-44

Review lead levels with family

Confirm results with venous blood sample

Perform environmental history. Consider other children who may be exposed

Consider if a specific evaluation of the child is necessary such as an abdominal x-ray. Gut decontamination may be needed if leaded foreign bodies are visualized in x-ray

Consider iron sufficiency, provide nutritional counseling r/t calcium and iron

Refer to case management

**FOLLOW UP:** Retest venous sample monthly until levels are <15, repeat every 1-3 months until levels are <5

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

### BLL >44

Review lead levels with family

Confirm results with venous blood sample

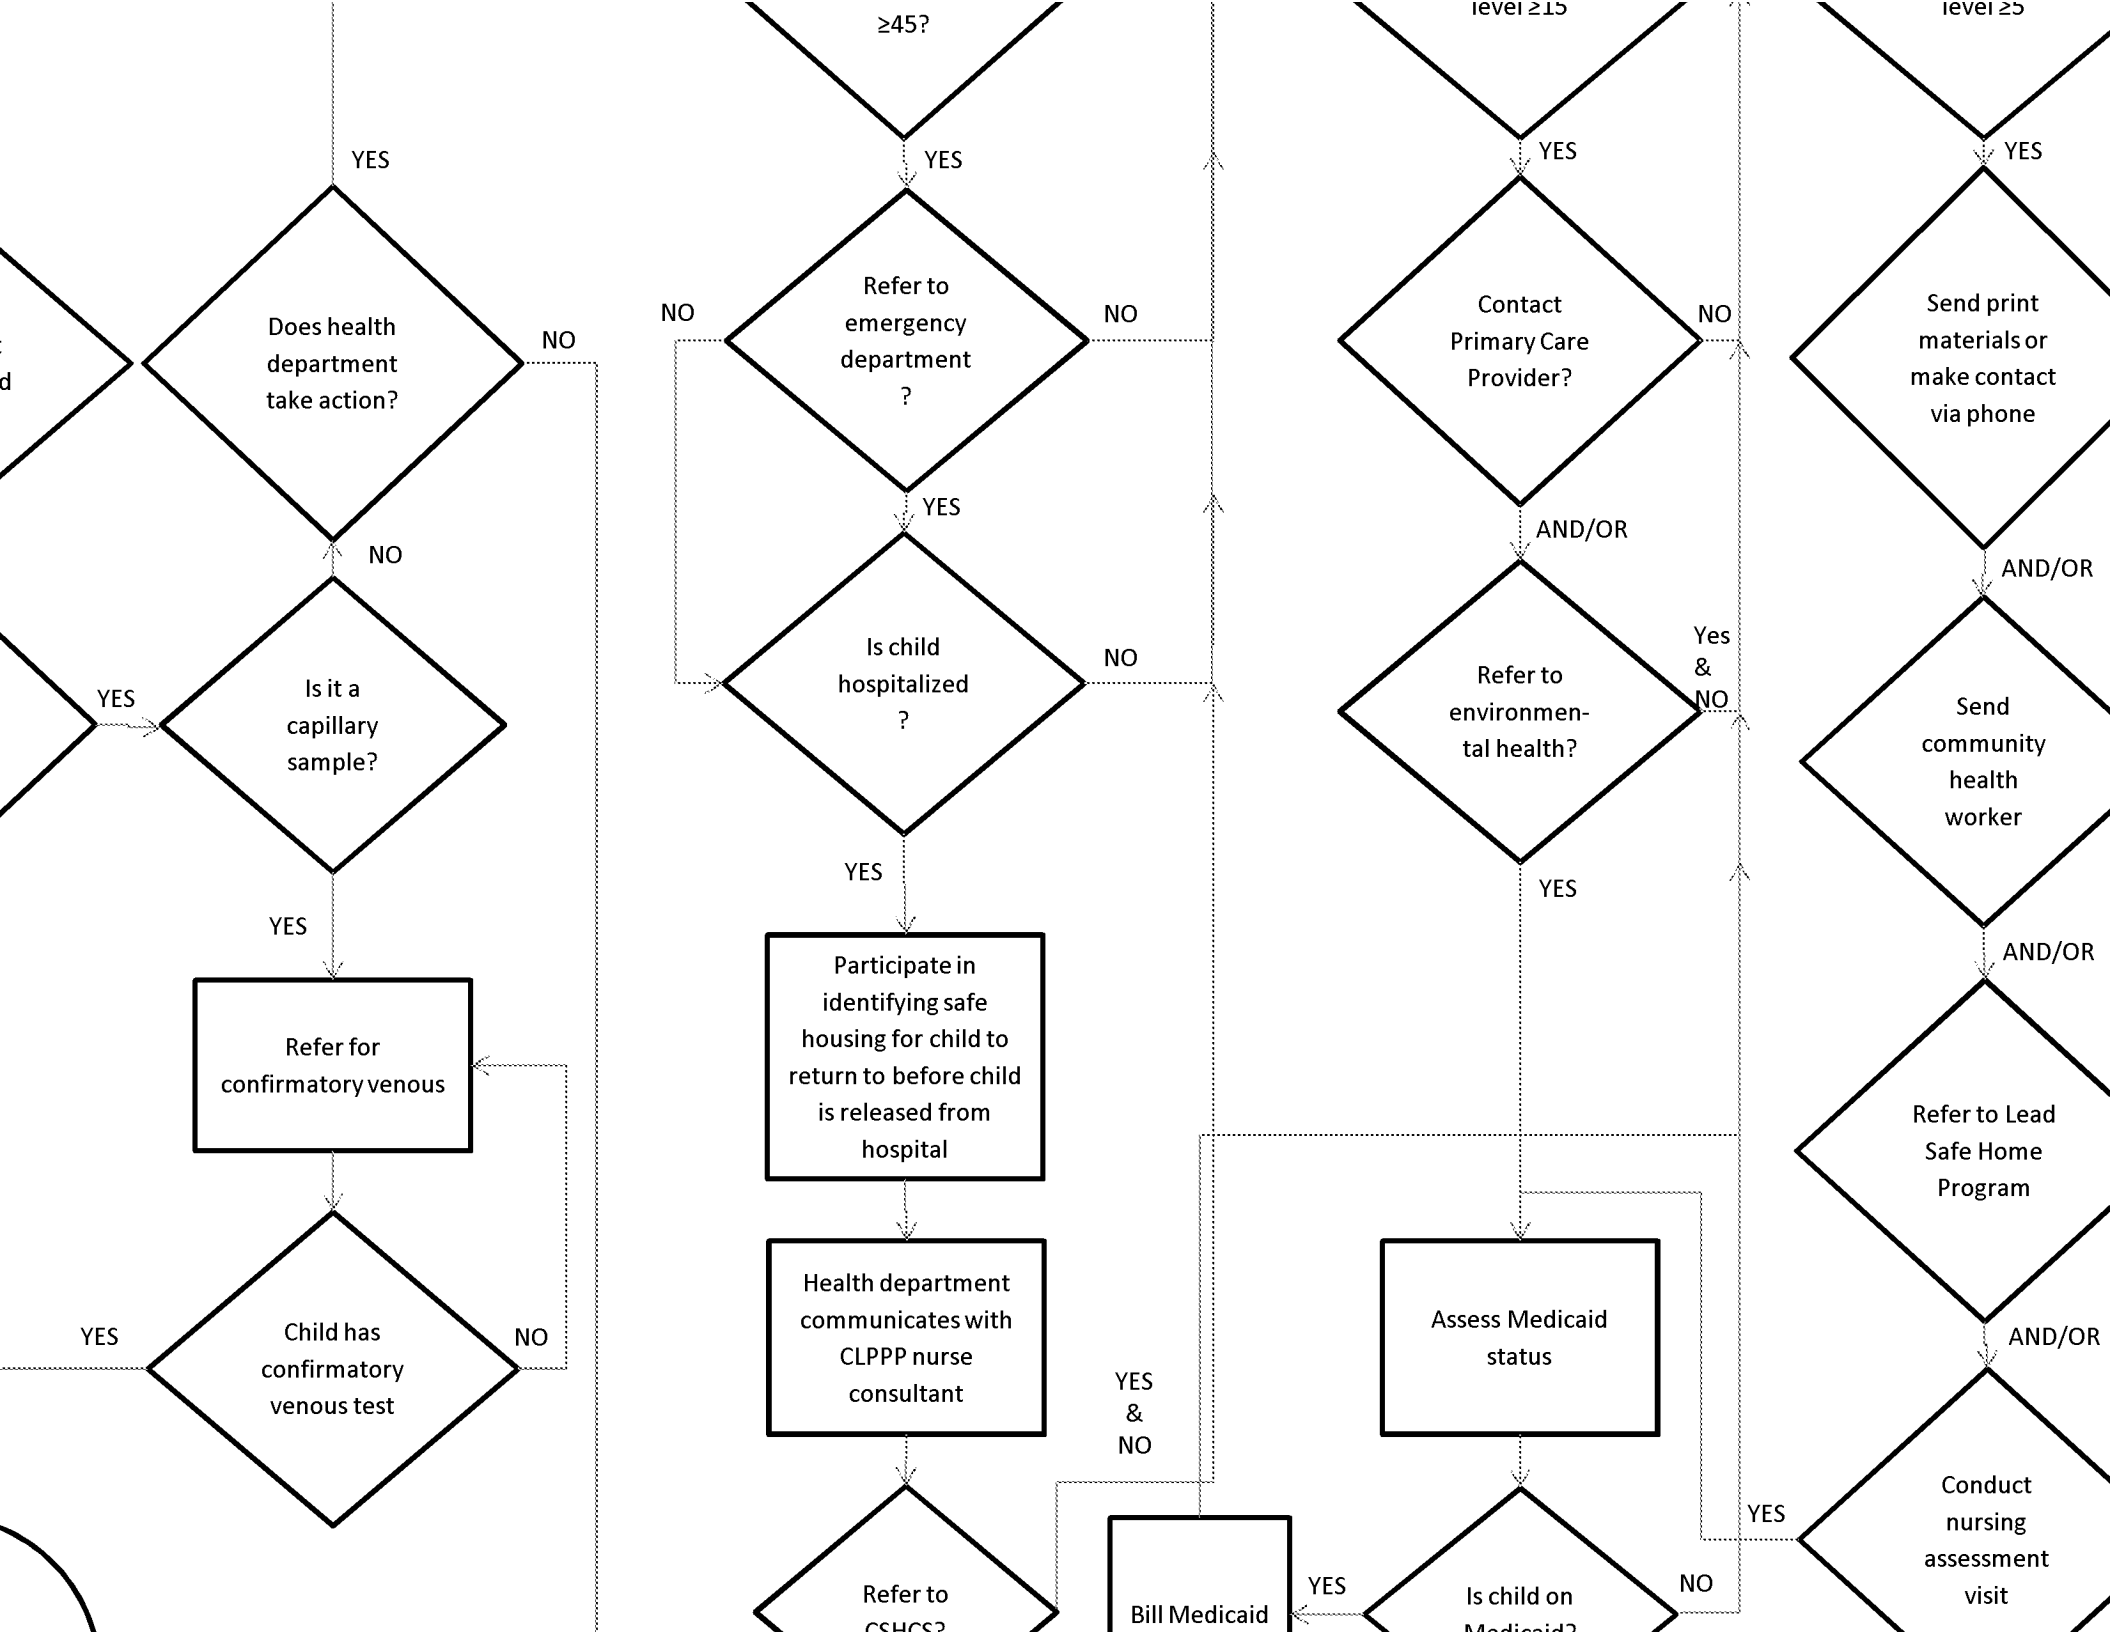

Review venous sample with family

Any treatment at this level should be performed in consultation with an expert at Children's Hospital of Michigan in Detroit.

**FOLLOW UP:** As directed by expert. Monthly venous samples will be required.

REMINDER: Medicaid requires all children to be tested at ages 1 & 2. Children who were not tested between 1 & 2 must be tested at least once between 3 & 6.

**Sent:** Wednesday, June 10, 2015 4:24 PM  
**To:** Scott, Robert L. (DCH)  
**Subject:** Re: Children BLL data with addresses

Thank you!

Just to clarify, on 3.a: can you give me "Date of Blood Draw"? Having at least the month would help me control for seasonality, but if it's not available, year is fine.

It might take me a while for the signature, because I will have to have MIT or the NBER (National Bureau of Economic Research, this is where the data will be stored and analyzed) sign it for me.

I have not run this through IRB yet, but will as soon as I can, and will send you the approval as soon as I have it.

2015-06-09 17:57 GMT-04:00 Scott, Robert L. (DCH) <[ScottR9@michigan.gov](mailto:ScottR9@michigan.gov)>:

Ludovica,

Your data use agreement looks good. I think you said enough about data security on page 3, but if I'm wrong they'll let us know. The only thing I need to change is in 3.a. I can't give you "Date of Blood Test" (date analyzed, I assume) because we don't keep it in our database. We have it in the original files submitted by labs, but that involves thousands of files in a variety of formats.

Yes, this will need MDHHS IRB approval. Has it gone through MIT's IRB already? If so, please send me a copy. I'll submit that along with the appropriate form and the DUA to my IRB. Please also delete the line about "Date of Blood Test" and then sign, scan and send the DUA to me again.

I'll do my best to move things along. This sounds like a great study!

Bob

**To:** Scott, Robert L. (DCH)  
**Subject:** Re: Children BLL data with addresses

Thank you!

Please find attached the form, filled in but without signatures. I believe that for the actual DUA, I will also have to go through MIT Office of Sponsored Programs, and have them sign as well.

I was vague about the time period requested, since I don't know when the data collection started.

Also: let me know if I need to be more specific about the data linkage procedure, and Data Security Measures: these were not explicitly asked in the form.

Finally, I believe IRB approval might be needed (I have checked that box), but let me know if it is not the case.

Best

**Subject:** Re: Children BLL data with addresses

Thank you!

Before I fill this in, I have a further question:

Does Michigan have a database of lead inspections and certifications and a database of licenses to lead inspectors and lead contractors? Would it be possible to access those data? In case, should I request the data in the same form you attached, together with the BLL, or would the request go through a different system?

Thanks!

**Subject:** RE: Children BLL data with addresses

Ludovica,

I'm happy to report that the revised lead reporting rules have been filed with the Office of the Great Seal, which means they are now in effect. I apologize for not notifying you sooner—I discovered today that they were filed May 7, but I hadn't been notified as expected.

Please fill out the attached form (as an unsigned draft) and return it to me. I'll move it along pronto. Keep in mind that all data use agreements these days have to go through the Department's Office of Legal Affairs for approval, but with the revised rules in place I don't expect a problem.

Thanks,

Bob

Dear Bob,

are there any updates on the possibility of diffusion of children's BLL data for research purposes?

If not: is there any possibility to get aggregate data? What level of aggregation would there be? I am trying to wrap up part of my research asap, and it would be useful to have health outcomes from Michigan.

Finally, does Michigan have a database of lead inspections and certifications? Would it be possible to access it? Feel free to refer me to someone else who would be in charge of this.

Thank you very much

The hearing went well, I guess. Aside from staff, only one person showed up, and he spoke in favor of the changes. No written comments were received. In other words, there was no opposition. The process still needs to grind through the remaining steps, which may still take several weeks, I'm told.

**Subject:** Children BLL data with addresses

Dear Robert,

we spoke on the phone during the summer, regarding the possibility of getting children BLL data with addresses to be linked to a housing dataset for a research project on the effectiveness of lead-safe housing regulations.

You mentioned that some changes in the law might be imminent, which would allow your office to release this data, conditional on IRB approval, and measures to ensure data security.

Please let me know if there has been any update.

My phone number is PPI if you need any further clarification and prefer to talk on the phone.

Best

Ludovica

**Subject:** Repeat of 2006 study request, but for Flint and Genesee County and Detroit zip codes, from January 1 2011 to present.

Hi Robert,

I would like to repeat the study I did below, but updated for Flint Michigan, Genesee Country Michigan, and Detroit. What I need is blood lead data from all Flint zip codes, Genesee County zip codes and Detroit zip codes from 2011 to present. Please do not identify the records by name, but have an ID code for each individual that can be sorted, along with the date of the measurement, blood lead result, zip code in which the child resides, and child's birth date so I can determine the age of the subject.

The intervention of interest, is the change from Detroit water to Flint River water, in Flint Michigan. Genesee County and Detroit serve as control data sets.

If it can be provided in a format that can be read into EXCEL, that would be best.

Let me know if you need a new signed data sharing agreement, or whether our agreement from 2006 is still ok.

Best Regards,  
Marc Edwards

Subject: Proposal and signed data agreement

Robert,

Attached is my signed agreement. My proposal is to do a study of potential benefits resulting from a community intervention in Lansing, MI.

Specifically, last year Lansing distributed drinking water filters and sent out enhanced flushing instructions to mitigate levels of lead in drinking water in homes with lead pipes. I am trying to determine whether this intervention had any discernable benefit on blood lead levels in the population.

To conduct this statistical test, I would like the following fields extracted from your database:

- 1) City of Lansing blood lead values, draw dates, and subject ID number from January 1 2001 to present. If you do not have accessible data starting in 2001, then go back as far as you can (e.g., 2002).
- 2) The same data for Ingham County (which I assume includes Lansing). If it is possible to get all data from within Ingham County but excluding Lansing that would be ideal. But I could presumably delete the duplicate data between set 1 and set 2 by hand if necessary.
- 3) The same data for the city of Detroit MI.

The statistical comparison will examine 1) temporal changes in % elevated blood lead for Lansing before and after the intervention, and 2) cross comparisons in trends between Lansing (with intervention) and Detroit and Ingham County (without intervention).

This is a fairly straightforward test that I suspect will confirm that no significant change arose due to the intervention in Lansing, consistent with water as a minor contributor to blood lead in Lansing.

If you should have additional questions please e-mail me at this address or call me at 540 231-7236,

Regards,  
Marc Edwards

Thanks for the info. Please see attached. Just a reminder that a "proposal" is also required. It need not be particularly long or formal, but should indicate clearly the data requested, and what you intend to do with it.

**DATA USE AND NON-DISCLOSURE AGREEMENT CONCERNING  
PROTECTED HEALTH INFORMATION OR OTHER CONFIDENTIAL INFORMATION**

Michigan Department of Health and Human Services

<b>Project Title:</b>	Flint Water Study		
<b>Data Recipient:</b>	Marc Edwards		
<b>Organization:</b>	Virginia Tech		
<b>Address:</b>	407 Durham Hall		
	Blacksburg, VA 24061		
<b>Phone:</b>	540 320 8740	<b>e-mail:</b>	edwardsm@vt.edu

In accordance with this agreement, data are provided by the Michigan Department of Health and Human Services (MDHHS), Bureau/Division on Date to the Data Recipient.

The parties agree to the provisions specified in this Agreement, the Health Insurance Portability and Accountability Act (HIPAA), and all other applicable public health, research, and confidentiality laws.

**SECTION 1: DATA SOURCE, PURPOSE, USE, DESCRIPTION, APPROVAL (IF HUMAN SUBJECT RESEARCH)**

**What is the Source of the Requested Data?** (e.g., Vital Records, Health Statistics, Cancer Surveillance, Medicaid, etc.)

Blood Lead Surveillance Data

**What is the Data Recipient's Purpose for, and Specific Use of, the Data?**

1. Describe why these data are requested (e.g., Research, Statistics, Public Health, Health Care Operations, Administration of the Medicaid Program).

We are researching the effects of interrupted corrosion control on lead in Flint's drinking water. Increased lead in drinking water can increase the incidence of childhood lead poisoning or elevated blood lead. The Michigan DEQ has issued a press statemetn, that said that they have studied the blood lead records and that there is no increase in blood lead of Flint residents since the switch to Flint River Water Source. I want to verify their claim scientifically by repeating their study.

2. Describe how the data will be used/disclosed, or incorporate by reference and attach a copy of the research protocol, work plan, or request letter that details the purpose and use of data, etc.

The analysis will be similar to an ecological study I conducted in Washington DC from 2000-2007. In that case the intervention was chloramination, whereas in Filint the intervention was changing from a non-corrosive source water to a corrosive source.

3. Describe the data requested indicating amount, type, by what medium the data will be provided, and whether the data recipient is granted access to the data warehouse or state archives.

I previously did a similar study in 2006, and the requested data was provided to me on CD-ROM.

- a. Specify the data elements (e.g., age, gender, etc.) and time periods (e.g., January 2003 through January 2005).

All blood lead data from all Flint zip codes, Genesee County (but not including zip codes) and Detroit zip codes from 2011 to present. Please do not identify the records by subject name, but have an ID code for each individual that can be sorted, along with the date of the measurement, blood lead result, area in which the child resides, and child's birth date so I can determine the age of the subject. Genesee County and Detroit serve as control groups to Flint..

- b. Specify if the data requested is identifiable, de-identified, or a limited data set as defined by HIPAA.

It would be de-identified if the zip codes for Flint are identified as Flint, zip codes for Genesee County (minus Flint) are identified as Genesee County, and Detroit zip codes are identified as Detroit. .

- c. Specify the medium requested (*e.g., electronic, hard copy, etc.*).  
Electronic
- d. Specify if direct access to the data warehouse or state archives is requested.  
No. Electronic is fine.

**Research Project:** Complete this box if requested data will be used for human subjects research.

Is Institutional Review Board (IRB) (human subjects research) approval required? If YES, MDHHS Approval Number..... (Attach MDHHS Approval Form)	<input type="checkbox"/> YES <input checked="" type="checkbox"/> NO Approval Number
Is HIPAA Informed Consent/Authorization Waiver Required? If YES, MDHHS Approval Number (if above IRB approval not required)..... (Attach HIPAA Waiver Authorization, if relevant.)	<input type="checkbox"/> YES <input checked="" type="checkbox"/> NO Approval Number

## SECTION 2: AGREEMENT CONDITIONS

**With regard to data provided under this agreement, the Data Recipient agrees to:**

1. Use and disclose the data only in accordance with this agreement, or as otherwise required by law;
2. Limit access to these data only to those described and authorized in this agreement; *(MDHHS may require the specific identification of the person(s) or the agency/division/office that is permitted access. Identify if needed.)*
3. Use appropriate safeguards to prevent use or disclosure of the information other than as provided by this agreement; *(MDHHS sponsor may require description of the security procedures that will be in place and followed.)*
4. Report to the responsible MDHHS sponsor any use or disclosure of information that is not provided for by this data use agreement;
5. Ensure that any agent(s) or subcontractor(s) who access these data agree to the same restrictions and conditions that apply to the data recipient; *(MDHHS sponsor may stipulate that release of data to a subcontractor cannot be done without the written authorization of MDHHS.)*
6. Make no attempt to identify or contact the individuals, providers, or health plans within the data provided unless approved in this agreement; *(Describe any agreed upon exceptions if needed.)*
7. Data recipient must provide MDHHS at least thirty days to review and provide comments on papers, publications, or presentations that the data recipient plans to submit for publication or presentation. Data recipient agrees that it will not publish or disseminate any protected health information, personally identifiable information, or data that might make it possible, directly or indirectly, to identify an individual. Data recipient must acknowledge the MDHHS program as appropriate (e.g., source of data, etc.), assume full responsibility for the analysis and interpretation of the data, and provide a copy of the publication or presentation to MDHHS. To the extent data recipient requires technical assistance in analyzing or interpreting the data and when such assistance goes beyond providing non-manipulated data, MDHHS reserves the right to request that these activities be considered a substantial contribution to the research being conducted and that the provision of such assistance may warrant MDHHS be considered as a research collaborator or co-author in any resulting publications or presentations;
8. Return or destroy all originals and copies of any potentially identifiable information upon completion of project, or upon request, unless otherwise approved in this agreement. This includes, but is not limited to: magnetic tape, micro disk files, paper records, etc. If not returned to the MDHHS, then the data must be destroyed; e.g., use a CD/DVD shredder to destroy CD Roms, DVDs, etc., erase floppy/zip disks using a magnet, shred paper records, clean computer hard drives with a program designed to wipe a disk by overwriting, etc.;
9. Not use the data provided to engage in any method, act, or practice which constitutes a commercial solicitation or advertisement of goods, services, or real estate to consumers; and
10. Not use the data provided as a basis for legal, administrative or other actions which may affect particular individuals or establishments as a result of their specific identification in this project.

The MDHHS may cancel this agreement with proper notice.

The unauthorized use or disclosure of confidential information is punishable by imprisonment or fine or both under state and federal laws specific to the data released.

I, the data recipient, have read, understand, and agree to the above conditions.

**Overview:** Flint, MI, is currently suffering from a “perfect storm” attributable to out-of-control corrosion of its potable water distribution system. The corrosion is undermining water affordability for residents, financial viability of city government, water aesthetics, and hygiene/sanitation as revealed in local and national news reporting. We *hypothesize* that these circumstances will also create severe chemical/biological health risks for Flint residents, including elevated levels of lead and opportunistic premise plumbing pathogens (OPPPs) in drinking water. Preliminary data collected from a home of a lead poisoned child in Flint has revealed extraordinarily high levels of lead, with average concentrations over 20 minutes of water use exceeding 2,000 ppb (> 200 times the World Health Organization allowable levels for lead in potable water).

The main *objectives* of this research are to: 1) compare levels of chlorine, iron, fecal indicator bacteria, OPPPs, and corrosion-inducing bacteria present in water mains of a distribution system with uncontrolled corrosion (Flint) versus surrounding cities/counties still using non-corrosive water, 2) profile OPPPs occurrence in hot and cold potable water systems at these same locations, and 3) determine if there is evidence of elevated lead in Flint homes, and, if so, forensically determine the links to iron corrosion. Our team is uniquely qualified to do this work given our just published peer reviewed research on this subject and our extensive collaborations with key stakeholders in Flint.

**Intellectual Merit:** The four elements of the “perfect storm” currently undermining water quality (and possibly public health) in Flint include: a) chronic underinvestment in water infrastructure, b) under-appreciation of the role of corrosion control in sustaining urban potable water systems, c) increased corrosion due to higher chloride in Flint’s new source water, and d) failure to appropriately monitor for lead and OPPPs. The latter two factors are amongst the most important health problems arising in modern potable water systems. The high rates of corrosion occurring in Flint are releasing high levels of iron to water and consuming chlorine disinfectant, which our most recent laboratory testing has indicated will increase lead release to water and growth of OPPPs in cold and hot water plumbing systems. The unfortunate but unique opportunity offered by Flint’s current situation, provides an ideal opportunity to field test our recent discoveries regarding potentially adverse consequences of iron corrosion on chemical/microbiological water quality at field rather than laboratory scale.

**Broader Impacts:** This RAPID grant will directly assist residents of Flint in assessing the current safety of their potable water supply. If the results support recently issued public assurances regarding safety of water, the current problems in Flint can be considered mainly of aesthetics and perception due to very distasteful or discolored water. However, if sampling reveals widespread problems, the public will learn of the potential health threat. Since elements of the “perfect storm” afflicting Flint are occurring at some level in many other financially stressed U.S. urban centers with decaying drinking water infrastructure, this Rapid Response Research (RAPID) grant also provides an unprecedented opportunity to advance fundamental scientific and practical understanding at this emerging nexus of infrastructure-environmental engineering-public health. The general results and approach used herein can inform residents and managers of other U.S. cities, who will soon be dealing with similar problems associated with failing potable water infrastructure exacerbated by increased chloride in water due to excessive use of road salt and rising sea levels. The research also provides a compelling case study in *Citizen Science*, since the experiences of Flint parents in monitoring their children’s health and environmental exposures was a trigger for our preliminary testing, and Flint consumers will be scientifically empowered by participating in fundamental research relying on collection of samples from their homes and residences. There is also a social justice implication of the research, in that these results can help inform the current policy debate regarding strategies for dealing with cities that have gone bankrupt, as well as the discussion of access to safe and affordable drinking water as a basic human right.

# RAPID: Synergistic Impacts of Corrosive Water and Interrupted Corrosion Control on Chemical/Microbiological Water Quality: Flint, MI

## 1. Problem Statement and Objectives

Flint, MI, is currently suffering from a “perfect storm” due to out-of-control corrosion of its potable water distribution system, undermining the well-being of the community including water affordability for residents, financial viability of city government, water aesthetics, and hygiene/sanitation.<sup>1-13</sup> Flint’s problems began in April 2014, when emergency managers hired to deal with the city’s fiscal crisis determined they could save money by switching to a local river water source as opposed to purchasing water from Detroit (Table 1). As a result of the change in source water, the Larson Iron Corrosion Index was raised from 0.54 (low corrosion) to 2.3 (very high corrosion) and the chloride to sulfate mass ratio (CSMR) index for lead corrosion increased from 0.45 (low corrosion) to 1.6 (very high corrosion). Concurrently, the managers and state primacy agency attempted to save even more money by not feeding an orthophosphate corrosion inhibitor to the water supply (Table 1).

Not surprisingly, the combined effect of more corrosive water and removal of the corrosion inhibitor unleashed unprecedented corrosion in the water main distribution system with cascading personal, economic, and public health consequences to Flint as tracked by news reports and mandatory chemical/biological monitoring of water in the distribution system mains.<sup>1-14</sup> *Our recent research also predicts that these circumstances will potentially create severe chemical/biological health risks for residents, due to impacts on water within building (premise) plumbing systems that include elevated levels of lead and opportunistic premise plumbing pathogens (OPPPs).*<sup>15-18</sup> Because the factors impacting Flint are also occurring at some level in many other financially-stressed U.S. urban centers with decaying drinking water infrastructure, this *Rapid Response Research (RAPID) grant provides an unprecedented opportunity to advance fundamental scientific and practical understanding at this emerging nexus of infrastructure-environmental engineering-public health.* We view August-September 2015 as the ideal time to first sample in Flint, as more than 16 months of uncontrolled corrosion have occurred and the water remains near its seasonal peak temperature, maximizing the likelihood of serious problems with lead and OPPPs if they exist.

*Our key hypothesis is that the rapid corrosion of iron water mains will dramatically increase lead release to water and growth of OPPPs as measured in consumers’ homes.* Mechanistically, higher iron corrosion produces both higher iron in water and lower levels of free chlorine, both of which dramatically increased lead release and OPPPs regrowth in our just published laboratory research utilizing simulated distribution systems.<sup>15-19</sup> The *main objectives of this research* are to: 1) compare levels of chlorine, iron, fecal indicator bacteria, OPPPs, and corrosion-inducing bacteria present in water mains of a distribution system with uncontrolled corrosion (Flint) versus controlled corrosion in surrounding cities/counties still using non-corrosive Detroit water, 2) profile hot and cold potable water systems at the same sampling locations in #1 for OPPPs, and 3) determine if there is evidence of elevated lead in Flint homes, and, if so, forensically determine the links to iron corrosion.<sup>15, 17-20</sup> The unfortunate but unique opportunity offered by Flint’s current situation provides an ideal opportunity to field test our recent discoveries regarding adverse consequences of iron corrosion on OPPPs and lead concentration at the tap.

**Table 1.** Water quality parameters for drinking water supplied in Flint, MI before and after the April 2014 switch

Parameter	Before <sup>1</sup>	After <sup>2</sup>
pH	7.38	7.61
Hardness (mg/L as CaCO <sub>3</sub> )	101	183
Alkalinity (mg/L as CaCO <sub>3</sub> )	78	77
Chloride (mg/L)	11.4	92
Sulfate (mg/L)	25.2	41
CSMR <sup>3</sup>	0.45	1.6
Inhibitor (mg/L as P)	0.35	NONE
Larson Ratio <sup>4</sup>	0.5	2.3

<sup>3</sup>A measure of corrosivity to lead; a value > 0.5 is a critical trigger [10]

<sup>4</sup>A measure of corrosivity to mild steel and iron; corrosion rate increases linearly with Larson Ratio [8]

## 2. Review of Local Events and Intellectual Merit

**Local Impacts.** After the switch of water sources, residents of Flint were immediately subject to an outbreak of corrosion-related drinking water problems including flooding from large water main breaks and reported health ailments.<sup>1-6</sup> General Motors, a prime customer of the water system, reported that the new water was severely corroding auto parts on its assembly line and had to begin importing water, costing the city \$400,000 in lost revenue.

<sup>9</sup> The PI was also alerted by an Environmental Protection Agency volunteer to a case of childhood lead poisoning in a Flint home that was certified as “lead free.”<sup>4</sup> Samples collected from the home exhibited classic “red water” that is occurring throughout the city (Figure 1), along with the highest sustained levels of lead in drinking water that we have encountered in over 25 years of research on the subject. Specifically, in 30 samples collected over a period of 25 minutes flushing at the kitchen faucet, lead concentrations averaged over 2,000 ppb and were as high as 13,000 ppb. For perspective, these levels are more than 200-1,300 times higher than World Health Organization standards (10 ppb) and several even exceeded the EPA criterion for “hazardous waste” of 5,000 ppb Pb. The city has also reported unspecified economic losses due to water main breaks and water losses through leaks.<sup>3,7,11-12</sup>

Figure 1. Drinking water samples collected from home of a child who was lead poisoned by Flint water.

The corrosion problems have also had cascading impacts on health parameters monitored under federal regulations. Because the corrosion is rapidly consuming chlorine disinfectant in the water, the city violated EPA limits for *E. coli*.<sup>5-6</sup> The detaching iron rust also has the potential to expose consumers to other contaminants that pose a serious public health risk, including arsenic<sup>14</sup> and lead that have accumulated in pipes or sorbed to iron surfaces.<sup>15-16</sup> Health effects reported by residents since the switch include skin rashes, hair loss, vomiting, copper poisoning, and the one confirmed case of lead poisoning.<sup>2-4,7,13</sup> However, the relatively small number of cases reported to date almost certainly underestimates the full extent of the problem. In response to the sampling showing high lead, the authorities who made the decision to switch water sources and stop adding corrosion inhibitor publicly stated that “anyone who is concerned about lead in the drinking water in Flint can relax” and that the water is safe,<sup>44</sup> but refuse to sample consumers’ water without pre-flushing the plumbing for at least 5 minutes the night before sampling. The latter practice is known to miss lead in water problems.

We are also concerned about possible health effects that have not yet been investigated. For example, in March 2015 Region 5 EPA was provided reports of higher incidence of Legionnaires’ disease associated with bacteria growth in premise plumbing in the Flint area.<sup>21</sup> Legionnaires’ disease has recently been acknowledged to be the primary source of waterborne disease outbreaks (and associated deaths) in the U.S.<sup>22</sup> Despite that acknowledged risk, there is currently no required monitoring for this important pathogen in consumers’ homes, where it proliferates and can lead to human exposure and infection in showers.<sup>22</sup>

**Intellectual Merit.** The four elements of the “perfect storm” currently undermining water quality (and possibly public health) in Flint include: a) chronic underinvestment in water infrastructure, b) under-appreciation of the role of corrosion control in sustaining urban potable water systems, c) increased corrosivity of water sources nationally due to rising chloride levels from anthropogenic pollution and/or rising sea levels, and d) failure to appropriately monitor for lead and OPPPs, which are two of the most important modern-day public health problems arising in building plumbing systems.

- a) **Chronic Underinvestment in Water Infrastructure.** A large fraction of the nation’s potable water infrastructure is on the verge of failure, and this problem has been repeatedly voted by

members of the American Society of Civil Engineers (ASCE) as the most urgent societal infrastructure challenge with an overall condition grade of “D”.<sup>23,24</sup> Many water main distribution systems are reaching the end of their design lifetime (60-95 years), with water main breaks currently at a rate of 240,000 per year nationally and rising.<sup>25,26</sup> Aside from obvious public health implications associated with compromised delivery of uncontaminated drinking water to the tap, failure events can cause property damage and water loss through leaks.<sup>27</sup> Like many post-industrial manufacturing centers, Flint has a very large potable distribution system constructed to sustain a large consumer and industrial base that no longer exists. The projected cost to upgrade the distribution system is \$1.5 billion dollars,<sup>28</sup> which would translate to an unbearable cost of \$50,000 per existing customer in Flint.<sup>28</sup>

**b) Under-appreciation of the role of corrosion control in sustaining potable water systems.**

Estimates by ASCE, the American Water Works Association (AWWA), the Environmental Protection Agency (EPA), the Water Infrastructure Network (WIN), and the National Academy of Corrosion Engineers (NACE) suggest that direct costs of water pipeline corrosion range between \$8 billion - \$36 billion annually and indirect costs are much higher.<sup>27</sup> Leaks result in 7 billion gallons of lost water each day with associated revenue losses of  $\approx$  \$3 billion per year for U.S. utilities.<sup>29</sup> Problems with leaking potable water plumbing systems in buildings (i.e. premise plumbing) also cost consumers billions of dollars each year.<sup>30,31</sup> Water utilities can reduce costs of potable water system corrosion and extend the lifetime of these invaluable assets by adding corrosion inhibitors, such as orthophosphate, to the water. Prior research using a relatively low corrosivity source water determined that each dollar invested in corrosion control produced more than \$5 dollars in financial savings due to reduced corrosion damage and extended lifetime of pipeline infrastructure.<sup>32</sup> In Flint, the short-sighted decision to reduce chemical costs by removing the corrosion inhibitor and introducing corrosive water to the system may have produced tens if not hundreds of millions of dollars in corrosion damages to its existing potable water distribution system. We are also aware of many other utilities that are cutting back on their corrosion inhibitor doses due to cost-cutting pressures.

**c) *Increased corrosivity of water sources nationally due to rising chloride levels from anthropogenic pollution and/or rising sea levels.***

Chloride levels in drinking water are rising nationally in surface water due to use of road salt and seawater intrusion in coastal regions. Road salt use in winter has risen to 137 lbs per year for every American, with a doubling of salt application from 1990 to 2014 (10 vs. 22 million tons) associated with a doubling of chloride levels in northern U.S. waters as monitored by the USGS.<sup>33,34</sup> There is documented concern about the damage of salt application to infrastructure such as roads and bridges,<sup>35</sup> but rising salt levels in the Potomac (due to road salt) in 2015 also have triggered a spike in consumer complaints of red or brown water from their main distribution system.<sup>36,37</sup> and we are currently working with a utility in Brick, NJ that is reporting high lead in consumers' water due to higher chloride from rising sea levels near their intake as well as road salt use.<sup>38-40</sup> The higher corrosivity of water in Flint due to higher chloride (Table 1), therefore provides an interesting “acute” case study of higher chloride impacts that can shed light on these important national trends.

**d) *Failure of utilities and regulatory agencies to take responsibility for the two most important modern day public health problems arising in building plumbing systems (i.e., lead and OPPPs).***

For ten years EPA has acknowledged that utilities are collecting samples in a manner that “misses” worst case lead in water,<sup>41-43</sup> and to date they have not required utilities to change monitoring practices to better reveal problems. The EPA LCR sampling protocols have been under review since 2008 and the EPA is expected to issue new requirements sometime in 2016. Hence, sampling in Flint without “pre-flushing” to reduce lead, as revealed by the EPA

volunteer,<sup>4</sup> could inform modifications to the EPA LCR. Likewise, EPA's current regulations on *Legionella* consider only levels that might be present in water leaving the treatment plant, where it is least likely to be present, and do not yet require monitoring at the point of entry into homes or within buildings where *Legionella* is most likely to be present and cause disease.<sup>21</sup> Our proposed sampling for *Legionella* at these locations can therefore inform future regulation and distribution system management policies for dealing with this emerging public health risk.<sup>19,22</sup>

In summary, this proposed RAPID grant characterizing the occurrence of chemical/biological problems in Flint, MI homes explores a newly emerging nexus between degrading infrastructure-environmental engineering-public health that can provide insight into problems facing many cities all over the United States.

### 3. Approach

The **RAPID grant objectives** will be achieved through three phases of sampling, using analytical methods in routine use by the project team, as follows:

**Phase 1. Compare levels of chlorine, iron, fecal indicator bacteria, OPPPs, and corrosion-inducing bacteria present in water mains of a distribution system with uncontrolled corrosion (Flint) versus controlled corrosion in surrounding cities/counties still using non-corrosive Detroit water.** A team including the PI and at least 3 graduate students will travel to Flint and stay 3-7 days in mid-August 2015, to collect 8 distribution system samples from surrounding cities still using Detroit water, and to also sample Flint's 8 distribution system monitoring locations (Figure 1). We will stay in two hotel rooms, one located in Flint and one in a surrounding location on Detroit water, to conveniently collect samples for free chlorine at 2 hour intervals expected to correspond to lowest and highest daily demand. All of these analyses will be conducted using standard methods with the exception of testing for corrosion-inducing bacteria which will be conducted with Biological Activity Reaction Test (BART) kits. BARTs are standardized colorimetric culture kits that are semi-quantitative and include testing for Sulfate-Reducing Bacteria (SRB), Heterotrophic Aerobic Bacteria, Heterotrophic Anaerobic Bacteria, Denitrifiers, Slime Forming Bacteria, and Acid Producing Bacteria (APB). It is hypothesized that the Flint waters will have much lower levels of free chlorine, higher levels of iron, corrosion-inducing bacteria, and fecal indicator bacteria than samples collected from locations still on Detroit water.

**Phase 2. Profile building hot and cold water plumbing systems for OPPPs at the same sampling locations used in Phase 1.**

Protocols used previously to sample for a suite of OPPPs and two host protozoa<sup>18,20</sup> in hot and cold water from taps and biofilms of buildings using quantitative Polymerase Chain Reaction (q-PCR) analysis, will be used to profile the hot and cold water systems for human pathogens at the same locations tested in Phase 1. Specifically, target microbes including *Legionella pneumophila*, *M. avium*, *P. aeruginosa*, *Acanthamoeba* and *Vermamoeba vermiformis* will be quantified by qPCR, and hot water samples will be cultured for *Legionella* and

Figure 2. Blue areas indicate areas served by Detroit water before the city of Flint switched (left) and distribution of Flint monitoring stations (right).

*Mycobacteria* from each location. Samples collected for microbial analysis and fecal indicator bacteria (Phase 1) will be overnight shipped from Michigan via cold-pack using protocols developed by the project team on NSF Project CBET-1438328. In Flint, for comparison, at least three additional privately owned homes will be sampled for OPPPs using the same protocols as for the public buildings.

**Phase 3. Determine if there is evidence of elevated lead in Flint homes.** We will coordinate with several local citizen groups including the American Civil Liberties Union (ACLU), Concerned Pastors for Social Action, and others to sample homes in Flint for lead in water. We will prepare 300 sampling kits with instructions, to collect water samples according to standard EPA LCR protocols for shipment to community groups. Each kit will contain three bottles to sample water after standard water stagnation (> 6 hours) at typical-use flow rates, including 1) first draw standard LCR (1 liter), 2) 45 second flushing 0.5 liter sample (targeting the lead service line, if present), and 3) 5 minutes of flushing 0.25 liter sample. Each kit will have a sample form to fill out information including 1) name of person collecting sample, 2) age of home (if known), 3) mailing address of home sampled, and 4) date of sample collection. A phone number will be provided of a member of the Virginia Tech team, who can answer questions that residents have about the instructions (if any). Residents will be instructed to return the sampling kits to a centralized location according to procedures that best suit each citizen group. The sample kits will then be put into boxes provided by the project team, and shipped back to Virginia Tech with the postage paid by the RAPID grant. Assuming a response rate of 33%, 300 samples ( $= 0.33 \times 300 \times 3$  bottles per kit) will be analyzed for lead, iron, copper and other constituents using the PI's Inductively Coupled Plasma Mass Spectrometer (ICP-MS). All returned kits will be analyzed, and results will be summarized in a letter to each consumer to be sent out within 1 month of receiving the samples. We will provide a phone number of a senior research scientist (Dr. Jeff Parks) that the residents can call to ask questions about their results if they have them and compile the results in a summary form for research publications and public outreach.

#### 4. Project Management and Prior NSF Support

The senior project team (Edwards, Pruden, Falkinham) has collaborated together extensively and has a strong record of success. They will be assisted in leading the project by Dr. Brandi Clark (former NSF graduate fellow) who is a recent graduate of Virginia Tech (2015). Edwards and Clark will coordinate the Flint site visit and the lead survey. Another NSF graduate fellow (Emily Garner, formerly Emily Lipscomb) who is currently co-advised by Pruden/Edwards will assist the Flint site visit team and coordinate biological sample analysis and shipments. Pruden and Falkinham will assist in the data analysis, interpretation and write-up of the results.

#### 5. Broader Impacts

In addition to improving practical and scientific understanding related to two of the most important problems associated with potable water and health in consumer homes (i.e., lead and OPPPs), this RAPID grant will directly assist residents of Flint in assessing the safety of their potable water supply. The results and approach used herein can inform residents and managers of other U.S. cities who will soon be dealing with similar problems associated with failing potable water infrastructure and increased corrosivity of potable water. Phase 3 of this research also provides an interesting case study in *Citizen Science* as a tool to advance scientific understanding, policy, and public health, because consumers are actively collecting samples from their homes and will be participating in National Science Foundation research. The work also has social justice implications, as the plight of Flint residents has already received national attention, and results can inform the current debate regarding access to safe, affordable water as a “right” for Americans in U.S. cities.

Yes, I think there is clearly some urgency to the situation.

MDEQ has publicly stated that your blood lead records, are showing that there is no public health concern for residents in Flint.

The levels of lead in Flint water, that we are finding in our water sampling, are certainly in a range that can cause childhood lead poisoning.

Indeed, one child has already, likely been lead poisoned from exposure to high lead in water.

I think the fact that you already have other teams working on these records, indicates a high level of interest, and urgency.

Congressional interest in the safety of the water is also very high, and this will be an important issue in deciding options for treating the water, in the weeks and months ahead.

Best Regards,

Marc

Maybe. My contact at Legal let me know the other day that he's unusually busy with other matters right now, so his review of DUAs might be delayed unless there was a specific reason for quicker action on his part.

If you are in need of a reasonably-quick turnaround—i.e., a week rather than a month or so—then please send me a paragraph explaining why. I'll pass that along with your DUA.

If you're not in a hurry, then I'm all set for now—I'll submit your DUA as is.

**To:** 'scottrob@michigan.gov' <[scottrob@michigan.gov](mailto:scottrob@michigan.gov)>

**Subject:** Repeat of 2006 study request, but for Flint and Genesee County and Detroit zip codes, from January 1 2011 to present.

Hi Robert,

I would like to repeat the study I did below, but updated for Flint Michigan, Genesee Country Michigan, and Detroit. What I need is blood lead data from all Flint zip codes, Genesee County zip codes and Detroit zip codes from 2011 to present.

Please do not identify the records by name, but have an ID code for each individual that can be sorted, along with the date of the measurement, blood lead result, zip code in which the child resides, and child's birth date so I can determine the age of the subject.

The intervention of interest, is the change from Detroit water to Flint River water, in Flint Michigan. Genesee County and Detroit serve as control data sets.

If it can be provided in a format that can be read into EXCEL, that would be best.

Let me know if you need a new signed data sharing agreement, or whether our agreement from 2006 is still ok.

Best Regards,

Marc Edwards

Subject: Proposal and signed data agreement

Robert,

Attached is my signed agreement. My proposal is to do a study of potential benefits resulting from a community intervention in Lansing, MI.

Specifically, last year Lansing distributed drinking water filters and sent out enhanced flushing instructions to mitigate levels of lead in drinking water in homes with lead pipes. I am trying to determine whether this intervention had any discernable benefit on blood lead levels in the population.

To conduct this statistical test, I would like the following fields extracted from your database:

1) City of Lansing blood lead values, draw dates, and subject ID number from January 1 2001 to present.

If you do not have accessible data starting in 2001, then go back as far as you can (e.g., 2002).

2) The same data for Ingham County (which I assume includes Lansing). If it is possible to get all data from within Ingham County but excluding Lansing that would be ideal. But I could presumably delete the duplicate data between set 1 and set 2 by hand if necessary.

3) The same data for the city of Detroit MI.

The statistical comparison will examine 1) temporal changes in % elevated blood lead for Lansing before and after the intervention, and 2) cross comparisons in trends between Lansing (with intervention) and Detroit and Ingham County (without intervention).

This is a fairly straightforward test that I suspect will confirm that no significant change arose due to the intervention in Lansing, consistent with water as a minor contributor to blood lead in Lansing.

If you should have additional questions please e-mail me at this address or call me at 540 231-7236,

Regards,  
Marc Edwards

At 03:14 PM 11/17/2006, Robert L. Scott wrote:

Thanks for the info. Please see attached. Just a reminder that a "proposal" is also required. It need not be particularly long or formal, but should indicate clearly the data requested, and what you intend to do with it.

Bob, thank you. Attached are the two requested and completed (to the best of our knowledge) IRB application documents, as well as the IRB approval letter from our institution. Let me know if you require any further information from us. I have cc'd Jenny from our research department who can assist if we need further revisions.

Any follow-up on the EBL% for Flint kids less than 5, including recent months?

Thanks! Mona

Mona,

I'll be happy to help with this. We'll need you to submit a DCH-1294 Data Use Agreement (attached) and an IRB Initial Review Application - Abbreviated for review by the MDHHS IRB. The latter is available at [Michigan.gov/irb](http://Michigan.gov/irb) under "Information for New Applications." (The "Abbreviated" application is used whenever another IRB has already approved the project.) Please complete each of the two documents as far as you can, and send to me unsigned, as Word documents. I'll fill in the rest, and will send the DUA to our Legal department and the IRB app to our IRB contact. I'll ask each of them for as quick a review as possible.

Please let me know if you have questions.

Bob

Bob, I just received IRB approval to look at the City of Flint blood lead levels. I would love to get the raw data if that is possible. Attached is my study proposal and the IRB approval.

Specific fields that we are looking for include:

MCIR ID or some sort of identifier to ensure first time lead level only Zip code Date of Birth Date of Blood lead level Lead level

Would greatly appreciate your assistance! Thanks!

**DATA USE AND NON-DISCLOSURE AGREEMENT CONCERNING  
PROTECTED HEALTH INFORMATION OR OTHER CONFIDENTIAL INFORMATION**

Michigan Department of Health and Human Services

**Project Title:** Analysis of Pediatric Blood Lead Levels in Flint, MI

**Data Recipient:** Mona Hanna-Attisha, MD MPH

**Organization:** Hurley Medical Center

**Address:** One Hurley Plaza  
Flint, MI 48503

**Phone:** 810-262-7257 **e-mail:** mhanna1@hurleymc.com

In accordance with this agreement, data are provided by the Michigan Department of Health and Human Services (MDHHS), **Bureau/Division** on **Date** to the Data Recipient.

The parties agree to the provisions specified in this Agreement, the Health Insurance Portability and Accountability Act (HIPAA), and all other applicable public health, research, and confidentiality laws.

**SECTION 1: DATA SOURCE, PURPOSE, USE, DESCRIPTION, APPROVAL (IF HUMAN SUBJECT RESEARCH)**

**What is the Source of the Requested Data?** (e.g., Vital Records, Health Statistics, Cancer Surveillance, Medicaid, etc.)  
MCIR

**What is the Data Recipient's Purpose for, and Specific Use of, the Data?**

1. Describe why these data are requested (e.g., Research, Statistics, Public Health, Health Care Operations, Administration of the Medicaid Program).

These data are being requested for two reasons: the primary purpose is related to public health. We are looking at the impact so that measures can be implemented to address any increase in children with elevated blood levels. The data is also being for research purposes so our findings can be shared with other communities.

2. Describe how the data will be used/disclosed, or incorporate by reference and attach a copy of the research protocol, work plan, or request letter that details the purpose and use of data, etc.

Data will be deidentified once 1) one value per person has been selected, 2) whether or not they live in the higher risk part of Flint for lead has been coded, and 3) the timing of when they had their lead level (pre/post) has been determined. Data put into SPSS will not include any identifiers.

3. Describe the data requested indicating amount, type, by what medium the data will be provided, and whether the data recipient is granted access to the data warehouse or state archives.

**Data Overview Description**

- a. Specify the data elements (e.g., age, gender, etc.) and time periods (e.g., January 2003 through January 2005).  
Time period: January 2013 through Sept 15, 2015; Data Elements: medical record number, date of birth, date of blood draw, zip code, blood lead level, and primary medical doctor. Gender, race and insurance type are also requested if available.
- b. Specify if the data requested is identifiable, de-identified, or a limited data set as defined by HIPAA.  
Identifiable
- c. Specify the medium requested (e.g., electronic, hard copy, etc.).  
electronic
- d. Specify if direct access to the data warehouse or state archives is requested.

Not unless necessary for this request of data

**Research Project:** Complete this box if requested data will be used for human subjects research.

Is Institutional Review Board (IRB) (human subjects research) approval required?	<input checked="" type="checkbox"/> YES <input type="checkbox"/> NO
If YES, MDHHS Approval Number..... (Attach MDHHS Approval Form)	Approval Number
Is HIPAA Informed Consent/Authorization Waiver Required?	<input checked="" type="checkbox"/> YES <input type="checkbox"/> NO
If YES, MDHHS Approval Number (if above IRB approval not required)..... (Attach HIPAA Waiver Authorization, if relevant.)	Approval Number

## SECTION 2: AGREEMENT CONDITIONS

### **With regard to data provided under this agreement, the Data Recipient agrees to:**

1. Use and disclose the data only in accordance with this agreement, or as otherwise required by law;
2. Limit access to these data only to those described and authorized in this agreement; *(MDHHS may require the specific identification of the person(s) or the agency/division/office that is permitted access. Identify if needed.)*
3. Use appropriate safeguards to prevent use or disclosure of the information other than as provided by this agreement; *(MDHHS sponsor may require description of the security procedures that will be in place and followed.)*
4. Report to the responsible MDHHS sponsor any use or disclosure of information that is not provided for by this data use agreement;
5. Ensure that any agent(s) or subcontractor(s) who access these data agree to the same restrictions and conditions that apply to the data recipient; *(MDHHS sponsor may stipulate that release of data to a subcontractor cannot be done without the written authorization of MDHHS.)*
6. Make no attempt to identify or contact the individuals, providers, or health plans within the data provided unless approved in this agreement; *(Describe any agreed upon exceptions if needed.)*
7. Data recipient must provide MDHHS at least thirty days to review and provide comments on papers, publications, or presentations that the data recipient plans to submit for publication or presentation. Data recipient agrees that it will not publish or disseminate any protected health information, personally identifiable information, or data that might make it possible, directly or indirectly, to identify an individual. Data recipient must acknowledge the MDHHS program as appropriate (e.g., source of data, etc.), assume full responsibility for the analysis and interpretation of the data, and provide a copy of the publication or presentation to MDHHS. To the extent data recipient requires technical assistance in analyzing or interpreting the data and when such assistance goes beyond providing non-manipulated data, MDHHS reserves the right to request that these activities be considered a substantial contribution to the research being conducted and that the provision of such assistance may warrant MDHHS be considered as a research collaborator or co-author in any resulting publications or presentations;
8. Return or destroy all originals and copies of any potentially identifiable information upon completion of project, or upon request, unless otherwise approved in this agreement. This includes, but is not limited to: magnetic tape, micro disk files, paper records, etc. If not returned to the MDHHS, then the data must be destroyed; e.g., use a CD/DVD shredder to destroy CD Roms, DVDs, etc., erase floppy/zip disks using a magnet, shred paper records, clean computer hard drives with a program designed to wipe a disk by overwriting, etc.;
9. Not use the data provided to engage in any method, act, or practice which constitutes a commercial solicitation or advertisement of goods, services, or real estate to consumers; and
10. Not use the data provided as a basis for legal, administrative or other actions which may affect particular individuals or establishments as a result of their specific identification in this project.

The MDHHS may cancel this agreement with proper notice.

The unauthorized use or disclosure of confidential information is punishable by imprisonment or fine or both under state and federal laws specific to the data released.

I, the data recipient, have read, understand, and agree to the above conditions.

**DATA RECIPIENT SIGNATURE:**

Name of Responsible Data Recipient (Type or Print)	Title
--	-------

Signature of Responsible Data Recipient	Date
---	------

**MDHHS SIGNATURES:**

**MDHHS SPONSOR**

Name of Responsible MDHHS Sponsor (Type or Print)	Title
---	-------

Signature of Responsible MDHHS Sponsor	Date
--	------

**MDHHS RESPONSIBLE PARTY**

Name of MDHHS Director, Bureau Director, or Delegated Authority (Type or Print)	Title
---	-------

Signature of MDHHS Director, Bureau Director, or Delegated Authority	Date
--	------

AUTHORITY: This form is acceptable to the Michigan Department of Health and Human Services as compliant with HIPAA privacy regulations, 45 CFR Parts 160 and 164 as amended.

COMPLETION: Is required if disclosure is requested.

The Michigan Department of Health and Human Services is an equal opportunity employer, services, and programs provider.

**Subject:** Re: question on email response regarding Flint blood lead data

I'm sitting in Zoe's quantum mechanics class, no clue what these differential equations are telling me, but I am stewing a bit about this situation. I want to say that you always do a great job, and are responsive to all data requests, and advocate to help researchers get whatever paperwork completed and turned in. That's why this feels so inappropriate to me - this isn't your fault, thus my earlier comment about apologizing less. And having said that, it probably wasn't a really helpful comment toward revising the response.

The email you received could be read as an intent to escalate and spin things, and I don't think you need to get caught up in that. A calm, fact-based response is very appropriate.

I think your first paragraph is good, but I would remove the last sentence, as I'm not sure what policies you are referencing beyond state and federal law -- and, I think the state and federal law carry enough weight that our departmental policies probably don't change much of anything about the process.

For paragraphs 2 and 3 I think I would just say state the facts, which is that both requests are in process in accordance with departmental policies - because they are. You really don't need to apologize for taking vacation, and I consider anybody's vacation time to be a normal part of doing business - none of us are expected to be at our desks every day, and there is no way to predict what might come up when we are planning to be away.

In your 4th paragraph, it looks like he is changing his data request? I appreciate your generosity in taking on responsibility to do his work for him (editing his paperwork) - your option, whether you want to do that, or request that he re-do it. I would outline the steps, clarify that you have confirmed the process which revealed the extra step, and let him know you'll watch for his response.

Finally, I might close with the piece about a small program, responsible for processing a high number of results every day or week (you sent me a number last week) in order to get them out to the professionals working directly with children and families, which IS the purpose and highest priority of our program.

I hope some of this is helpful and not too late - hope the rest of the day goes better. Thank you for all you do!

Angela or Jennifer,

Please see Dr. Edwards email below, and my draft response to him. I'm not very happy with him right now, but tried to respond appropriately. Given the sensitive nature of the situation, I'm checking with you first. Nancy is on annual leave, but I've CC'd her here.

Is it OK to send this? Please feel free to make changes as appropriate. I'm also asking if it's OK now to share the attached PDF with Dr. Edwards and Dr. Hanna-Attisha.

Thanks,  
Bob

Marc,

As you well know, the data you and Dr. Hanna-

Attisha are requesting are derived from personal health data, which of course is confidential. There are state and federal laws governing what can be shared, and how, with researchers or the public. In addition, my Department has policies on how to determine what can be shared.

I worked with you earlier this month to get data to you relatively quickly, but did not manage to complete the process before I went on annual leave for several days. I neglected to inform you that I'd be away, and I apologize for not informing you. Unfortunately we are a very small program, and there's no one else here to process your request—or Dr. Hanna-Attisha's.

Since I returned on Wednesday, my time has been largely taken up with my Department's response to the current situation in Flint. I did manage to correspond to Dr. Hanna-Attisha, and provided her with the forms she'll need for her request. I hope to submit her request to our Legal office and to our IRB contact today.

Sorry I haven't responded to your email from Monday—as I mentioned above, I was away, and then have been juggling many tasks since I returned. I think you'll be able to get approval for data with zip code identified. I'll edit your data use agreement accordingly, and will adjust it to say "limited data set" instead of "de-identified." I'll re-submit your DUA to Legal today. You will need to submit an MDHHS IRB review application (attached) because this is considered research. You should also submit a "HIPAA Waiver Request" (attached). (I wasn't aware of that when we talked earlier this month.) I don't know whether you'll need to go through an IRB review with your institution.

I've also attached a PDF that includes the numbers behind the graphs you referred to, and I'm CC'ing Dr. Hanna-Attisha so that she has it as well.

Dear Robert,

I just spoke to this young researcher at Hurley, and apparently, she has been unable to get access to the state blood lead records.

I have to say, it is very disturbing that the state keeps issuing these blood lead reports and statements in their press releases, and refuses to share the data backing them up with outside researchers.

Even worse, state reps are running around claiming that these reports are proof that Flint water is safe to drink.

Can you tell me why it is so difficult to get this data, and why your agency is raising so many obstacles to sharing it with everyone who asks? I note that I have been asking to see your data since MDEQ first sent it to reporters back in August, and I count 10 e-mails that I sent responding to all your questions. As of yet, you have given me nothing in response. Yet you have been sending reporters one report after another. It seems your agency is more interested in public relations than sound science.

In the meantime, can I at least be given the numbers of EBL cases and number of tests each month, that are the basis for the latest graph your agency is sending to the press...or is that top secret as well?

Marc

Mona,

When you get the data let me know. Since you are involved and have apparently requested the data already (independently), I will not be bothering Robert further.

However, I will be speaking out, about the unethical behavior of the state in not sharing the data to date, and their abusing of power to discredit the work you have done.  
The second they give you the data I will stop speaking out.

Robert, I apologize to you because I know you did not have anything to do with it, but what is happening here is just wrong.

Best Regards,

Marc

**Subject:** RE: Automatic reply: New DCH-1294, time-sensitive

I understand that, and I appreciate what you are doing.

I also hope you can understand my frustration, at seeing this data given to reporters in an relatively unprocessed and unscientific format, used to support a claim that there is not a problem with lead in water in Flint.  
And worst of all, seeing it used to "refute" the sound science that Mona did with her in-house data. I know you did not have anything to do with that, but I strongly feel that what is happening is unethical.  
I hope you send my message to whoever is abusing the data (and the public trust, and the science method) in this way.

I will be calling the state out on this abuse, as long as it continues. I stand by my statements this is third rate and unscientific science that is being circulated by the state, and your department should have expedited Mona's requests to get access to the data. I am probably going to step aside and let her handle it from here, and as soon as you get her the data I will stop speaking out. She has proven herself to be a capable researcher.

You should also tell the team that is analyzing the data, that lead in water often peaks in the summer months, and declines in the winter months. It is clear from their one pager that they do not know the first thing about lead in water.

Thanks Bob. We greatly appreciate all your assistance and your hard work!

It's interesting to note that the number of children tested in July and August of 2015 is so small as compared to the same months in previous years? Do you think those numbers capture all the tests that were done -- is there a lag time in reporting to your system?

Thanks! Mona

Jenny,

As long as this request is for "research," then I don't think it will be a problem to provide addresses. You're correct, it would then be considered "identifiable." One thing that might slow it down—I believe you'd have to go back to Hurley's IRB and get approval for the change.

Bob

**Subject:** State data - Dr. Mona Hanna-Attisha

Hi Bob,

My name is Jenny LaChance, and I have been working with Mona on the data. We are now doing in depth GIS analysis, which involves actual address (beyond zipcode). Would adding actual address slow down the request for the State data? I believe this would not longer be a limited data set. Any advice or guidance would be truly appreciated.

Thank you so much!  
Jenny

One Hurley Plaza  
Flint, Michigan 48503

DATE: September 25, 2015

TO: Mona Hanna-Attisha, MD MPH  
FROM: Hurley Medical Center Institutional Review Board

STUDY TITLE: [807433-3] Analysis of Pediatric Blood Lead Levels  
VERSION #: #3, Dated 09/25/2015  
SUBMISSION TYPE: Amendment/Modification

ACTION: APPROVED  
APPROVAL DATE: September 25, 2015  
EXPIRATION DATE: September 15, 2016  
REVIEW TYPE: Expedited Review

Dear Dr. Hanna-Attisha:

As Chair of the Hurley Medical Institutional Review Board, an **expedited review** was conducted to consider the changes to the following documents for the above-referenced prospective human subjects research project:

- Amendment/Modification - Revised proposal (UPDATED: 09/25/2015)
- Application Form - Revised with investigator and new numbers (UPDATED: 09/25/2015)
- HIPAA Waiver - Revised for addresses (UPDATED: 09/25/2015)
- Letter - summary of changes (UPDATED: 09/25/2015)
- Other - List of variables/information requested (UPDATED: 09/25/2015)

Following my review, it was determined that this request for expedited review represents a minor modification, and the amendment to the above documents would not pose any increased risk to research participants.

This preliminary determination will be reviewed at the next full IRB meeting. Your attendance is not required.

Best wishes in your investigative research endeavors.

Sincerely,

Harland Verrill Ph.D.  
Chair, Institutional Review Board

This letter has been electronically signed in accordance with all applicable regulations, and a copy is retained within Hurley Medical Center's records.

**Study Title:** Analysis of Pediatric Blood Lead Levels in Flint, MI

**Responsible Department Employee:** (please enter Responsible Department Employee's name here)

**Primary Investigator:** Mona Hanna-Attisha MD MPH

**Research Staff Requiring Access to Protected Health Information (PHI):**

Mona Hanna-Attisha MD, MPH; Jenny LaChance MS; Richard Sadler PhD

**Name(s) of Covered Entity(ies) and Location(s) Where PHI Will Be Reviewed:**

Hurley Medical Center, One Hurley Plaza, Flint, MI 48503

Division of Public Health, College of Human Medicine, Michigan State University, 200 East 1st Street Room 337, Flint, MI 48502

**PHI Required and Intended Use:**

Child ID number, date of birth, date of blood draw, address with zip code.

Child ID number is required so that we can remove duplicate entries when one child has multiple lead level results.

Date of birth and date of draw are needed to calculate age at time of blood draw.

Date of blood draw is also needed to determine time period in relation to water switch.

Address with zipcode is needed for GIS analysis and to determine if child lives in potentially high risk area for lead.

**Does the use or disclosure of the PHI involve more than minimal risk to the privacy of the potential subjects?** (please select one answer) ☐ YES ☒ NO

Data will be kept very secure through the use of encrypted thumb drives (or on hospital secure computers in individual researchers' offices) and only seen by 3 researchers. Data will be with one of the researchers or in a locked office at all times. Identifiers will be removed for files for analysis as not needed and all identifiable data destroyed once not needed.

**Describe your plan to destroy identifiers at the earliest opportunity consistent with conducting the research. (All identifier links must be destroyed for minimal risk research. For other research, unless there is a health or research justification for retaining the identifiers or such retention is otherwise required by law. If retention of identifiers is required, explain the reason and indicate that the identifiers will be stored and retained.)**

As soon as data files and analysis are completed, files with identifiers will be destroyed. For GIS analysis, data and analysis file with address will be kept until after all work on data is complete, including dissemination and time for peer response.

**Describe your plan to adequately protect the identifiers from improper use and disclosure (Check all that apply and explain other protective measures you will use):**

- X Names and other direct identifiers of individuals will be removed at the earliest possible time if consistent with research design
- X Protected health information (PHI) will be kept in locked storage when not in use
- X Records of research subjects or potential subjects will be kept separate from other patient records
- X Access to records will be restricted to those persons directly involved in the research
- NA Records of individuals not selected to participate in research will be destroyed as soon as possible
- X If researcher discloses PHI to a third party (e.g. a research sponsor, data analyst, centralized database, etc.) researcher has received written assurances that the third party will maintain confidentiality of the PHI

(please describe additional protections to be employed here)

**Describe why the study could not practicably be conducted without access to and use of the protected health information (PHI) requested:**

(please provide a detailed description here)

Child ID number is required so that we can remove duplicate entries when one child has multiple lead level results.

Date of birth and date of draw are needed to calculate age at time of blood draw.

Date of blood draw is also needed to determine time period in relation to water switch.

Address with zipcode is needed for GIS analysis and to determine if child lives in potentially high risk area for lead

All of the above are needed to assess the change in lead levels in children in Flint, MI. Without each of these elements, we wouldn't be able to assess the impact.

**Describe why the study could not practicably be conducted without this Waiver of Authorization:**

Without the waiver, we could not identify if the child lived in an area with Flint water, if the child was younger and therefore potentially more vulnerable, if the data is unique lead result for 1 child. Finally, without the waiver we would not be able to determine if the lead value was from before or after the water switch.

**Statement of the Primary Investigator:**

*I affirm that:*

- *The requested access, use or disclosure of PHI is necessary for the purposes of the proposed research;*
- *The requested access, use or disclosure of PHI is solely for the purpose for which waiver is being requested;*

- *The waiver of authorization will not adversely affect the welfare or privacy rights of the research subjects;*
- *The benefits of research outweigh the risks to the privacy rights of the research subjects;*
- *The requested information constitutes the minimum necessary data to accomplish the goals of the research; and,*

Thanks bob. So it's not possible to get the real values (with decimals)?

What about levels of "undetectable" - what are they converted to?

Mona Hanna-Attisha MD MPH FAAP

Mona,

The integers in your file are the values we have stored in our blood lead surveillance system; that's our current protocol.

To my knowledge, the CDC's Lead program has not taken a stance on whether to store decimals or not.

Bob

Quick question:

We have the data and are starting to geocode it!

All of your lead level results are single numbers with no decimals?? It's kinda weird. All of our lab data included decimals and there was also kids with <0.5 levels (undetectable).

Does your lead data just not have decimals? Do numbers get round up or round down?

Thanks! Mona

(I do understand that it's Friday. Sorry.)

Good afternoon, Mona -

Today is Bob's scheduled day off. He came in to prepare and send the file, but has left for the rest of the day. I will see if I can reach him to find out what step to take to get you access to the data.

Can you give me any more detail that I can share with him, if I can reach him? It sounds like you did receive the email with the file attached, and the password (I assume via fax). If those two pieces are in place, is the issue that it won't 'unzip'?

Nancy Peeler, Manager  
Early Childhood Health Section

We are unable to open the file that you sent. Can you try to send again or let us know how to open it another way. Thanks! We were really hoping to review today. thanks!

**Subject:** RE: 2014 lead data  
**Attachments:** Just Dates.xlsx; Documenting the SAS code.docx; Lead 2014 by zip.xlsx; 2014 zips.xlsx

Bob,

I ran the data for 2014 and I believe that the differences are due to rounding, though I haven't quantified them yet.

I'm copying Yan because she may have a way to look at this quicker, faster and easier than us manually reviewing records.

Yan,

Bob and I analyzed 2014 by zipcode for the state and got different numbers. We have been asked to find out why.

The Just Dates excel file is from Bob- where he looked at individual level data to try to figure out if the difference could be due to the way we are categorizing age.

(You could create SAS dataset, which may make it easier to analyze. ☺)

Documenting the SAS code is my attempt to quantify each step by age group.

Lead 2014 by zip is my analysis with SAS

2014 zips is Bob's analysis

Bob has 143,123 for 2014 and I have 141,355 for children less than 6 years.

Yan, can you compare Bob's Just dates to the 2014 analytic file we created in SAS.

Also I see results that have missing for sample type so we are including them –I thought this might be a difference too.

I suspect it has to do with INTCK –do you know how it handles rounding?

Thanks,

Patti

When I ran by report date today ( I check for late reports) the earliest reports were for August 2015.

I will record the numbers for duplicates at every step

**Subject:** RE: 2014 lead data

I used specimen date.

Maybe a slight difference in the way we calculated age at test? I used this: (Specimen Date – Date of Birth)/365.25 and then included all children < 6.00 years of age.

**Subject:** FW: 2014 lead data

Bob and Patti – Can you explain why Bob's total for 2014 (143,123 – see attached) is bigger than Patti's (141,355) . Is this because bob uses report date and Patti used specimen date?

**Subject:** RE: 2014 lead data  
**Importance:** High

I talked with Jennifer Eisner and here is what we need:

Only the 2014 data (not 2015 since we don't typically release a year's data before the year is completed), by zip code for all of Michigan with small cells suppressed. And only confirmed venous tests as CLPPP has done for previous years: we'll explain that we're including capillary tests in the Flint reports in an effort to capture all possible EBL children.

Could I please have an estimate of when this can be done?

**Subject:** RE: 2014 lead data

**Importance:** High

Ok, I deleted all the chatter in-between.

I believe the request is for annual 2014 and 2015 (not by quarter) for all Michigan zip codes (suppressing cells less than 6). The data provided should match what we're reporting to the Director/Governor, so retain the highest test whether venous or capillary.

Jennifer/Geralyn: is that accurate?

**Subject:** Re: 2014 lead data

To clarify you want 2014 by zip code and quarter with retaining highest test? Or only highest venous test?

Im still in a meeting and may not get this done today. Will also talk to Yan to see if she is available.

Patti

**Subject:** FW: 2014 lead data

All –

A reporter with Bridge Magazine is requesting the statewide 2014 (and if possible, 2015) CLPPP data. Bob sent me the attached county-level info for 2014 which I have not shared yet, as it's not the final report.

We would like to touch base to make sure the data has been finalized and reviewed by epi before it's posted online.

Eden – we'll reach out to you in the morning to discuss the media request. Beyond the data, the reporter is also interested in discussing home lead investigations.

Hi Nancy,

I made a p-chart, which Shewhart's version of a control chart for proportions, for the data you sent. Basically, I used the monthly data from 2013-14 to create upper and lower control limits, then plotted the 2014-15 data in a run chart. It shows that the three months in question are the only ones that lie outside the control limit: in fact, they are the only points that lie well above the mean at all. This doesn't say anything about causality, but it does warrant further investigation.

There are several next steps we can employ if the folks upstairs ask us to look deeper into the data. Also, I'm not sure if you talked at all with the Environmental Health folks, but their toxicologists could probably help give us some context to the issue.

Cristin

Hello Nancy and Bob,

It turns out that adding in the additional two years of data did not change the results of the analysis: there does appear to be a higher proportion of EBLL last summer than usual. I wrote up my methods and results in the attached brief, just in case anyone asks for specifics.

Have a good night!

Cristin,

I can safely say I don't understand it without some explanation.

However, late yesterday Nancy and I decided to take a look two years farther back to see how they fit with the recent years. Please see attached, which I just finished this morning. Sorry I didn't have this for you yesterday before you did the analysis. Would this new information change the analysis?

Thanks,  
Bob

Nancy and Bob,

Is the control chart clear enough, do you think? I could whip up a fact sheet with a description of what it shows, if you think it would help make it more digestible for our audience.

# Elevated Blood Lead Levels Among Children <16 Years of Age

City of Flint, May 2011— April 2015

## QUESTION:

Were positive tests for elevated blood lead levels (EBLL) higher than usual for children under age 16 living in the City of Flint during the months of July, August, and September, 2014?

## METHODS:

- The number of children tested for lead poisoning varies from month to month, so the proportion of children with a first-time blood lead level  $\geq 5$   $\mu\text{g/dL}$  was calculated for each month (Figure 1).
- To determine whether or not the difference between the summer of 2014 and the previous three years warrants further investigation, a control chart for proportions (Figure 3) was constructed.
- Monthly data from May 2011 to April 2014 were used to construct upper and lower control limits (UCL and LCL) representing the amount of expected variation in EBLL (Figure 3).
- Finally, proportions of EBLL from May 2014 to April 2015 were plotted in Figure 3.

**Figure 1. Formula for Calculating Monthly Proportion of Children with Elevated Blood Lead Levels**

$$\frac{\text{Number of Children with Blood Lead Level } \geq 5 \mu\text{g/dL}}{\text{Total Number of Children Tested}} = \text{Proportion with EBLL}$$

**Figure 2. Proportion of Children Tested for Lead Poisoning with Elevated Blood Lead Levels, May 2011—April 2015**

**Figure 3. Control Chart of Proportion of Children Tested for Lead Poisoning with Elevated Blood Lead Levels, May 2014—April 2015**

---

## RESULTS:

- Figure 2 shows that—on average—there appears to be a higher proportion of first-time EBLL during the summer months of July, August, and September.
- However, even compared to the previous three years, the proportion of first-time EBLL is highest during summer 2014 (Figure 2).
- Based on the control chart for proportions (Figure 3), only the summer months of July, August, and September had proportions of EBLL higher than that expected from random variation over time.
- Further, the summer months of 2014 were the only data points between May 2014 and April 2015 with EBLL proportions above the average (mean) of the previous three years (Figure 3).

## CONCLUSION:

- Based on the results depicted in Figure 3, positive tests for EBLL were higher than usual for children under age 16 living in the City of Flint during the months of July, August, and September, 2014.
- However, it's important to note that the purpose of control charts is to monitor data for the quick detection of abnormal variation—not to construct a case for causality.

## SOURCES:

- Data for the City of Flint was provided by the Childhood Lead Poisoning Prevention Program at the Michigan Department of Health and Human Services (MDHHS). Information is current as of July 27, 2015.
- Control chart methods are based on The Six Sigma Way Team Fieldbook: An Implementation Guide for Process Improvement Teams, by Peter Pande, Robert Neuman, and Roland Cavanagh.

Team,

Here's the data that will be presented at the Hurley Hospital press conference at 3 p.m. As you'll see, they are pointing to individual children, a very emotional approach. Our challenge will be to show how our state data is different from what the hospital and the coalition members are presenting today.

Dave

# **PEDIATRIC LEAD EXPOSURE IN FLINT, MI: CONCERNS FROM THE MEDICAL COMMUNITY**

---

(this will not be written. I will introduce myself, Dr Reynolds can introduce himself and then I will say that we are here as a medical communitiy representing: GFHC, GCMS, Hurley Med Center, Hamilton Health Network)

# THANK YOU'S

---

(this will not be written.

Thank you to Hurley for hosting this press conference, TY to grassroots organizers, prof Edwards and virginia tech, state and federal agencies involved in keeping our water safe, the city for being concerned and taking action, and health department for ensuring the safety of the entire population??

# Introducing Makayla\*

- 12 month old girl (DOB 8/15/2014) presented last week for her 1 year old check up. No concerns.
- Lives with single mom and 2 older siblings in west side (48504). Formula from WIC; powder mixed with warm tap water.
- Physical exam and development are normal. Makayla receives her 1 year old vaccines and routine lead and hemoglobin screening.
- *A couple days later, lead level comes back as 6 ug/dL.*

\*Hypothetical scenario

# Blood lead level of 6 ug/dL....

- Blood lead levels (BLL) above 5 ug/dL are considered elevated blood lead levels (EBL)
- Just a few years ago (2012), 10 ug/dL was cutoff
- Increasing evidence shows NO safe blood lead level
- Disproportionately impacts low income children
- Primary prevention is most important
  - Prevents exposure before it occurs!

# Primary Prevention

- “Because no measurable level of blood lead is known to be without deleterious effects, and because once engendered, the effects appear to be irreversible in the absence of any other interventions, public health, environmental and housing policies should encourage **PREVENTION** of all exposure to lead.”

“Low Level Lead Exposure Harms Children: A Renewed Call for Primary Prevention.” 2012 CDC Advisory Committee on Childhood Lead Poisoning Prevention.

# What will happen to Makayla?

- Vast evidence supports increased likelihood of:
  - Decrease in IQ
    - An increase in BLL from 1 to 4 ug/dL, drops mean IQ -3.7 points
  - Small change in mean IQ, shifts entire population IQ distribution
    - Reduces high achievers IQs (>130) and increases kids with low IQs (<70)
    - Implications for early intervention, special education services, employment, incarceration, life achievement, etc

Lanphear BP et al., Low-level environmental lead exposure and children's intellectual function: an international pooled analysis. *Environ Health Perspect*, 2005. 113:894-9.

Fewtrell LJ, Pruss-Ustun A, Landrigan P, and Ayuso-Mateos JL, Estimating the global burden of disease of mild mental retardation and cardiovascular diseases from environmental lead exposure. *Environmental Research*, 2004. 94:120-33.

# Behavioral Burden

- Increased likelihood of :
  - ADHD behaviors
  - Delinquent behaviors and arrests
  - Total arrests and increased rates of arrests involving violent offenses
- Other health effects: hematologic, cardiovascular, immunologic, endocrine, etc

Wright, JP, KN Dietrich, MD Ris, et al. 2008. Association of prenatal and childhood blood lead concentrations with criminal arrests in early adulthood. *PLoS Med* 5(5): e101

Chen, A, B Cai, KN Dietrich, et al. 2007. Lead exposure, IQ, and behavior in urban 5-7 year-olds: Does lead affect behavior only by lowering IQ? *Pediatrics* 119(3): e650-e658.

Needleman, HL, C McFarland, RB Ness, et al. 2002. Bone lead levels in adjudicated delinquents: A case control study. *Neurotoxicology and Teratology* 24(6):711-717.

# The Cost

- “For childhood lead poisoning, \$5.9 million in medical care costs, as well as an additional **\$50.9 billion** (sensitivity analysis: \$44.8–\$60.6 billion) per year in lost economic productivity resulting from reduced cognitive potential from preventable childhood lead exposure.”
- “The present value of Michigan’s economic losses attributable to lead exposure in the 2009 cohort of 5 year-olds ranges from \$3.19 (using U.S. blood lead levels) to **\$4.85 billion** (using Michigan blood lead levels) per year in loss of future lifetime earnings.”

Leonardo Trasande and Yinghua Liu. Reducing The Staggering Costs Of Environmental Disease In Children, Estimated At \$76.6 Billion In 2008. *Health Affairs*, 30, no.5 (2011):863-870  
The Price of Pollution: Cost Estimates of Environment-Related Childhood Diseases in Michigan. 2010 Report by Michigan Network of Children’s Environmental Health

# Lead in Water

- Increasing as source of lead because of success in controlling other sources.
- Increasing due to aging water infrastructures, change in water sources, disinfectant uses, etc
- Lots of variability in water lead levels depending on internal and external pipes, use of water, temperature, etc
- Disproportionally impacts developmentally-vulnerable formula-fed infants and pregnant mothers
  - Formula preparation

# Role of the Pediatrician

- Prevention of everything to optimize children's health
- Lead screening as recommended by CDC and AAP at 1 and 2 years of age
- Inquiry and advocacy

# RESEARCH FINDINGS

---

# Results of Pediatric Blood Lead Levels

## • **Methods**

- Data from all blood lead levels processed at Hurley Medical Center
- HMC Institutional Review Board (IRB) approved
- All children under 5 years of age
- Zip codes 48501-48507
- Two periods of comparison:
  - PRE-SWITCH: January 1, 2013 – September 15, 2013
    - **WATER SWITCH APRIL 2014**
  - POST-SWITCH: January 1, 2015 – September 15, 2015

# Results of Pediatric Blood Lead Levels

## • **Methods**

- Analyzed % Elevated Blood Lead (EBL)
  - EBL = Blood lead Levels > 5 g/dL
- EBL analysis conducted based on scientific literature (most notably DC lead in water exposure)

# Blood Lead Level Analysis

- Large sample size
  - N= 1746 for Flint children (pre n=906, post n=840)
  - N= 1670 for non-Flint children (pre n=943, post n=727)

## **Flint results for children 5 years and under:**

- PRE-SWITCH % EBL: **2.1%** (consistent with MDHHS data 2.2)
- POST-SWITCH % EBL: **4.0%**
- **$p < 0.05$ ; STATISTICALLY SIGNIFICANT CHANGE**

# Zip Codes With High Water Lead

- Focus on zip codes (48503 and 48504) with high water lead levels
- Total n=742, pre n=394, post n=348

## Results:

- PRE-SWITCH % EBL: **2.5%**
- POST-SWITCH % EBL: **6.3%**
- **$p < 0.05$ ; STATISTICALLY SIGNIFICANT CHANGE**

# What was rest of county doing?

- Analysis of same time periods for Genesee County children who live outside of City of Flint zip codes (non 48501-48507)
  - N=1670 for non-Flint children (pre n=943, post n=727)

## Non-Flint results for children 5 years and under:

- PRE-SWITCH % EBL: **0.6%**
- POST-SWITCH % EBL: **1.0%**
- **p = 0.637; NO STATISTICAL CHANGE**

# Blood Lead Level Analysis

- % EBL all children less than 5 years of age

	<b>ALL FLINT (n=1746)</b>	<b>HIGH- water lead FLINT (n=742)</b>	<b>REST OF FLINT (n=1004)</b>	<b>NON- FLINT (n=1670)</b>
<b>PRE-SWITCH</b>	<b>2.1%</b>	<b>2.5%</b>	<b>1.8%</b>	<b>0.6%</b>
<b>POST-SWITCH</b>	<b>4.0%</b>	<b>6.3%</b>	<b>2.4%</b>	<b>1.0%</b>

# Blood Lead Level Analysis – 15 month

- % EBL children 15 months or less
  - Total Flint n=619, pre n=295, post n=324 (smaller sample size)
  - Total Non-Flint n=816, pre n=443, post n=376

	<b>ALL FLINT (n=619)</b>	<b>HIGH- water lead (n=269)</b>	<b>REST OF FLINT (n=350)</b>	<b>NON- FLINT (n=816)</b>
<b>PRE-SWITCH</b>	<b>1.0%</b>	<b>1.5%</b>	<b>0.6%</b>	<b>0.5%</b>
<b>POST-SWITCH</b>	<b>2.5%</b>	<b>4.4%</b>	<b>1.1%</b>	<b>0.5%</b>

# Graphical Summary

## Change in % EBL Flint vs Non-Flint

# Graphical Summary

## Change in % EBL by area

# Conclusions from BLL analysis

- Based on our research, % of children with EBL in Flint has increased
  - Most striking increase in zip codes with highest water lead levels
  - Also saw an increase in kids less than 15 months, sample small
- Results underestimate risk:
  - Infants not screened for lead
  - BLL may have peaked before being measured
  - Water usage has dropped

# Recommendations

- AAP and CDC recommendation of primary prevention
- Limit further exposure
  - Encourage breast feeding
  - No tap water for high risk groups: infants on formula & pregnant mothers
  - Distribution of lead clearing NSF-approved filters
  - Public education regarding precautions (flushing, cold water, etc)
  - Connect to Lake Huron water source
- Support city's health advisory and health department's public education efforts

# And Makayla...

- Asymptomatic now
- But what will her future hold and an entire generation of Flint children if we don't err on the side of safety?

Angela,

One suggested change to the second bullet:  
"The analysis that Hurley conducted is different from the way MDHHS has analyzed data regarding blood lead levels in Flint."

Another suggestion for the 5<sup>th</sup> bullet under Differences in Analysis:  
"The MDHHS analysis looks specifically at the first elevated blood lead level for each child, which provides an accurate picture of when first exposure occurred."

Thanks,  
Bob

**Subject:** Flint Talking Points

Hi everyone,

With the Hurley press event at 3pm, can you please take a look at the following/attached talking points to make sure these are accurate and send me your edits?

Thank you.

- 
- The results of the Hurley Children's Hospital are under review by the Michigan Department of Health and Human Services.
  - The analysis that Hurley conducted is different than the way MDHHS collects data regarding blood lead levels.
  - MDHHS is looking to see if we can replicate the results of the Hurley study to see how they achieved their results.

#### *Differences in Analysis*

- MDHHS data provides a much more robust picture of the entire blood lead levels for the Flint area, and specifically, accounts for data over the full course of the past five years.
- Looking at the past five years as a whole provides a much more accurate look at the seasonal trends of lead in the area.

- Seasonal exposure is higher in the summer for a variety of reasons including children playing outside in the soil, and when windows are open and lead paint is more likely to be in the air. This seasonal increase would be unrelated to the water system.
- Our data includes children from the entire city, including all medical facilities, rather than just Hurley, has a larger age group of children, and includes a much larger sample size.
- MDHHS data also looks specifically at the first test with elevated blood lead levels which provides a much more accurate picture of when and how first exposure occurred.
- The Hurley data includes a smaller sample size, much more limited time period (January-September of 2013 and 2015 only), and a smaller age group of children.

#### *WIC Children*

- For children with elevated blood lead levels that receive WIC benefits, they may be eligible to receive ready made formula with a test result that indicates that the child has an elevated blood lead level.
- WIC cannot cover bottled water.

**Subject:** Re: flint lead powerpoint

Only thought - should we way that if results were being driven by the water supply, we would expect the rate to remain at a higher rate?

Also, I forgot this earlier, probably too in the weeds - Larry Reynolds kept mentioning MCIR data - I don't think they know what our data source is that we use. Should we add any kind of a talking point that says all data included in this analysis is reported directly from labs to MDHHS, in accordance with state law?

If you think it worth adding those, go ahead, and send on to Jennifer. Thanks!

**Subject:** Re: Flint follow-up

\f0Thanks for doing this!

\f0Based on reading the email from the Free Press person, maybe emphasize that looking at the big picture is probably more accurate than a strict year to year analysis. For example, the results for the months after the water source change look a whole lot like results a few years earlier when Flint WAS on the Detroit water.

\f0And, that paint is still the primary source of lead poisoning in our whole state AND in Flint, and that the biggest problem is still in Detroit.

\f0I'm running on, Blah blah blah - you'll do great!

Hi Angela,

Thanks for the feedback yesterday. I took a look at the numbers last night that you sent over and the year over year increase between 13/14 and 14/15 is statistically significant  $p < .05$

Can you ask you epidemiologist to confirm? Also, is this the first significant increase that Flint has seen for this cohort?

Thanks!

Kristi

I spoke with Cristin. I have extracted a file from the Warehouse with all tests for Genesee County, age

We talked about which test to use—I had been using the first elevated test ( $\geq 5$ , whether venous, capillary or unknown) and Cristin will probably do the same). Once Cristin has geocoded all records to identify which are in City of Flint and which are out-county, she can then slice and dice them as appropriate.

I'll be happy to help in any way I can.

Dear Brenda,

After seeing Gongwer on Friday AM, I contacted Corinne to understand what was going on, Linda Dykema and Angela later pulled in Epidemiology. I come out of environmental health (cut my teeth on superfund site in a politically complex area) and can appreciate sensitivity on multiple fronts, as well as appreciating the analyses of data at the local level (well done).

It would benefit all of us for epidemiology staff to be pulled in as quickly as possible in the future, so that Patti and I can assist Cristin, that we can weigh in on design issues, and we can make sure that we are not at cross purposes when Angela requests a response. Cristin's response will take some time.

Cristin and I discussed an approach on Friday before we received the report from Angela with the updated counts. We will take a look this AM and revise our approach.

Sarah

Obviously this is uber high profile---so we just need to be sure we're about the data, which as you and Sarah likely know, is under a lot of scrutiny because some of the local folks have different data (done differently, lots of issues---just this involves people who care deeply about the community, Larry Reynolds who is now on our iM Exec Team, etc) I'm just saying sensitivity to the local people who are so concerned about the babies there based on what they have for data is a context that is important, beyond the high profile and other issues . My comment has nothing to do with the data itself. Just the context of very concerned people. Doesn't impact our data . . . obviously. It's just there's a people side to this issue that sometimes gets lost when something becomes so politicized. Just for us, I guess.

Nancy

Cristin has been working all day on this. We are working together right now and expect to be doing so for a while this evening. We are committed to getting monthly proportion of tested positive graphic for each region (high risk, other flint, other Genesee) for 0-6 year olds for tomorrow am review by Corinne – we will forward when comfortable it is correct.

To do this, we are having to identify tests on a monthly basis for the denominator, up until (and including) the first incidence of high EBLI in the year. Then remove subsequent tests for that child in the rest of the calendar year. The whole thing starts over the next calendar year. We are in a maze of do-loops right now.

**Subject:** Re: State data confirms higher blood-lead levels in Flint kids

Dear Brenda,

After seeing Gongwer on Friday AM, I contacted Corinne to understand what was going on, Linda Dykema and Angela later pulled in Epidemiology. I come out of environmental health (cut my teeth on superfund site in a politically complex area) and can appreciate sensitivity on multiple fronts, as well as appreciating the analyses of data at the local level (well done).

It would benefit all of us for epidemiology staff to be pulled in as quickly as possible in the future, so that Patti and I can assist Cristin, that we can weigh in on design issues, and we can make sure that we are not at cross purposes when Angela requests a response. Cristin's response will take some time.

Cristin and I discussed an approach on Friday before we received the report from Angela with the updated counts. We will take a look this AM and revise our approach.

Obviously this is uber high profile---so we just need to be sure we're about the data, which as you and Sarah likely know, is under a lot of scrutiny because some of the local folks have different data (done differently, lots of issues---just this involves people who care deeply about the community, Larry Reynolds who is now on our iM Exec Team, etc) I'm just saying sensitivity to the local people who are so concerned about the babies there based on what they have for data is a context that is important, beyond the high profile and other issues. My comment has nothing to do with the data itself. Just the context of very concerned people. Doesn't impact our data . . . obviously. It's just there's a people side to this issue that sometimes gets lost when something becomes so politicized. Just for us, I guess.

**Subject:** FW: Public Health Advisory  
**Importance:** High

And Genesee County and the Genesee County Health Department, have just issued the attached public health advisory and on the final paragraph it says:

Recent data provided by Hurley Hospital researchers has indicated that a significant increase in blood lead levels has occurred in children since the switch to Flint River water. The county Health Officer has requested that the Michigan Department of Health and Human Services (MDHHS) provide to the County specific data to support its claim that state data is more comprehensive and does not show a significant increase. To date, the MDHHS has failed to confirm the geographic area included in their findings. We want to assure the state data is specific to the boundaries of the City of Flint, and not Flint addresses which would include addresses in areas outside of the City of Flint. These areas, such as Flint Township, that obtain their water from the Detroit Water Authority and would, therefore, not be representative of Flint River water as the water source. The County is prepared to take further action if the State fails to provide the requested data by September 30, 2015. Further action could include a request for outside independent evaluation of the data and to declare a Public Health Emergency in Flint.

I understand that we are still reviewing the data—but the county has basically issued a ransom date that they want this information by tomorrow.

Eden—please coordinate an answer so Nick can walk into the 1:00 p.m. meeting prepared on this.

I can partially answer your question now, will get additional info from Bob and send more later. The data flows in daily, year-round. We process several thousand test results every week. We monitor the results daily, and have an algorithm for our follow-up response, based on the blood lead level. Because we are processing results every day, we do see some patterns if they begin to emerge, especially with the higher lead levels. We normally track and report data at health department level, county level/Detroit. We are still building our capacity and putting new procedures in place via our CDC Surveillance grant to crank out more reports/report cards, and more frequent data reports, especially with the switch in focus to levels of 5 and above (which means we are focusing on a larger number of results than just 10 and above). We develop and share out many maps, charts, graphs, and yes, do publish an annual legislative report. We have .2 FTE Epi support (Cristin Larder), mostly for special projects and/or reports, for example, Cristin is working with us and Dr. Stan Kaplowitz from MSU to use his research to help pinpoint smaller geographic areas with higher risk, so we can better direct resources toward those areas. Bob, can you please add more information about frequency of your analysis, and how we detect issues?

**Subject:** RE: Hurley -- follow up about the question on Hurley lab results

That sounds about right.

May I ask,, is it CLPP's usual process to collect the lead data on an ongoing basis...if so, at what level is the data usually analyzed (by Epi?) IS it daily, nmonthly? Quarterly? Annually? How would we normally detect/know if there is an issue in a particular locality---do you look at it at county level or smaller when you peruse your data? This question may arise...

**Subject:** Hurley

Hurley Medical Center is listed as the “Provider” on approximately half of the blood lead results we received for Flint children in 2014—I assume that pattern holds in 2015 and in recent years. Warde Medical Lab is listed as the “Laboratory” on those results. Warde reported the results to CLPPP in accordance with State law.

I can’t say whether the blood specimens were a) drawn at Hurley’s lab, or b) simply passed through Hurley’s lab—from physician office to Hurley to Warde for analysis. As I understand it, both scenarios are common at various hospital labs.

## Blood Lead Levels in Flint Talking Points

October 1, 2015

---

- Initial analysis of MDHHS data found that blood lead levels (BLLs) of children in Flint have followed an expected seasonal trend; due to small numbers further analysis was initiated.
- While this analysis of blood lead levels in Flint as a whole remains true, after a comprehensive and detailed review down to the zip code level, we have found that the state analysis is consistent with that presented by Hurley.
- Director Lyon is working closely with DEQ and the administration to take active steps to reduce all potential lead exposures in Flint, and across the state.
- Our Chief Medical Executive has been in communication with the lead investigator at Hurley Children's Hospital, and we continue to work with Hurley, the city of Flint, local and state leaders to verify and analyze data trends.
- Zip code-level data does show that there has been an increase in elevated childhood blood lead levels in specific communities.
  - This does not conclusively mean that the water source change is the sole cause of the increase, but data does show an association.
  - There is an increased proportion of children with elevated Blood Levels (ELBs) in several zip codes, particularly 03 and 04. These appear to have increased over the last 1.5 years.
  - Lead exposure can occur from a number of different sources (such as paint, gasoline, solder, and consumer products) and through different pathways (such as air, food, water, dust, and soil).
  - Although there are several exposure sources, lead-based paint is still the most widespread and dangerous high-dose source of lead exposure for young children in the US and Michigan.
- We reviewed MDHHS statewide data using the same methodology used by Hurley, looking at our numbers by zip code and age ranges, and filtering out non-Flint children.
- Routine surveillance of blood lead levels does not analyze data down to the zip code level. Detailed analysis like this occurs when there is reason to focus in on precise locations or populations.
- MDHHS will be working closely with the Michigan Department of Environmental Quality, Hurley Children's Hospital, the Genesee County Health Department, and community organizations to initiate further action steps.
- We understand that cost may be a barrier to following the recommendations of the local health department. We are actively working with public and private partners to make resources available to those who may need assistance.

- MDHHS is recommending that residents follow the Public Health Advisory issued by the Genesee County Health Department, as well as take further steps to reduce exposures to all forms of lead in and around their homes.

#### *MDHHS Stats and Facts*

- 'High Risk' Zip codes (48503 and 48504)
  - Blood lead level rates among children under six years of age in the high risk zip codes (48503, 48504) were 2.7 times higher than the rest of Genesee County before the switch to Flint River Water.
  - After the switch to Flint River Water, rates in the high risk Zip codes were 3.2 times that of the rest of Genesee County.
- Other Zip codes in Flint
  - Rates of elevated blood lead levels among children under six years of age in other parts of the city of Flint were 2 times that of the rest of Genesee County before the switch to Flint River Water.
  - The magnitude of the elevated rate remained roughly the same during the period after the water source switch.
- Lead abatement through MDHHS was federally funded up until FY14 when Michigan began providing additional funds to abate homes.
- In FY14, \$1.25M General Fund was added. In FY15, General Fund was bumped up to \$1.75M and FY16, General Fund remains at \$1.75M.

#### *Water Filters*

- Our first action item is to work closely with our public and private partners to provide water filters to Flint residents and MDHHS clients.
- To meet this priority, the governor has identified one million dollars in state funding to purchase water filters for Flint residents.
- Given the questions and concerns regarding the change in water source in Flint, MDHHS has authorized the use of emergency services funding to provide water filters for MDHHS clients receiving assistance in the city of Flint.
- We are pursuing a plan for clients who are active Family Independence Program (FIP), Food Assistance Program (FAP), Child Development and Care (CDC), State Disability Assistance (SDA), State Disability Assistance (SDA), or Social Security Insurance (SSI) to that they can obtain filters that are National Sanitation Foundation (NSF) certified to remove lead and ANSI Standard 53.
- We are in discussions with local retailers and will share additional information about where residents can go to purchase filters as soon as those details have been finalized.

- MDHHS currently serves approximately 25,000 households in Flint.

#### *Reducing and Removing Lead Exposure*

- In housing built before 1978, it can be assumed that the paint has lead unless tests show otherwise.
- Make sure your child does not have access to peeling paint or chewable surfaces painted with lead-based paint.
- Children and pregnant women should not be present in housing built before 1978 that is undergoing renovation. They should not participate in activities that disturb old paint or in cleaning up paint debris after work is completed.
- Create barriers between living/play areas and lead sources. Until environmental clean-up is completed, you should clean and isolate all sources of lead.
  - Close and lock doors to keep children away from chipping or peeling paint on walls. You can also apply temporary barriers such as contact paper or duct tape, to cover holes in walls or to block children's access to other sources of lead.
- Regularly wash children's hands and toys. Hands and toys can become contaminated from household dust or exterior soil. Both are known lead sources.
- Regularly wet-mop floors and wet-wipe window components. Because household dust is a major source of lead, you should wet-mop floors and wet-wipe horizontal surfaces every 2-3 weeks.
  - Windowsills and wells can contain high levels of leaded dust. They should be kept clean. If feasible, windows should be shut to prevent abrasion of painted surfaces or opened from the top sash.
- Take off shoes when entering the house to prevent bringing lead-contaminated soil in from outside.
- Prevent children from playing in bare soil; if possible, provide them with sandboxes. Plant grass on areas of bare soil or cover the soil with grass seed, mulch, or wood chips, if possible.
  - Until the bare soil is covered, move play areas away from bare soil and away from the sides of the house. If you have a sandbox, cover the box when not in use to prevent cats from using it as a litter box. That will help protect children from exposure to animal waste.
- Avoid using makeup, containers, cookware, or tableware to store or cook foods or liquids that are not shown to be lead free.
- Remove recalled toys and toy jewelry immediately from children.
- Use only cold water from the tap for drinking, cooking, and making baby formula. Hot water is more likely to contain higher levels of lead. Most of the lead in household water usually comes from the plumbing in your house, not from the local water supply.

- Shower and change clothes after finishing a task that involves working with lead-based products such as stained glass, making bullets, or using a firing range.

#### *WIC Children*

- There are 855 infants participating in WIC in Flint.
- We are working with partners at the United Way to ensure that WIC families have access to water filters and bottled water.
- In homes with infants on WIC, if the household has documentation from an official source of unsanitary water supply issues, that family may be eligible to receive ready-to-feed formula. Families should contact WIC to see if they are eligible.
- Each household would have to be looked at on an individual basis.
- WIC cannot cover bottled water.

#### *Background*

- The results of the Hurley Children's Hospital were reviewed by MDHHS after the study was released last week.
- The analysis that Hurley conducted was different from the initial MDHHS data regarding blood lead levels in Flint.
- MDHHS initial data looked at the entire blood lead levels for the Flint area for the past five years and showed the annual seasonal trends in the area.
- Seasonal exposure is higher in the summer for a variety of reasons including children playing outside in the soil, and when windows are open and lead paint is more likely to be in the air. Further, seasonal variations in water can occur due to changes in temperature, pH , and other factors

Good morning, Nancy!

Please respond to me on this with a CC to Rashmi and Sue Moran. I have the heat map from last week, but he wants the numbers as well---

Good morning,

I will get information right away to CLPP on this- but there are established protocols, and they do involve the primary care provider as well. I have a heat map showing the numbers of children above 5 and 15 by zip, so I know we have those numbers as well. To you shortly,

E

On Mon, Oct 5, 2015 at 8:52 AM, Lyon, Nick (DHHS) <[LyonN2@michigan.gov](mailto:LyonN2@michigan.gov)> wrote:

So, I have a process question: If a child tests above 5 micg/dl, the suggested protocol is to provide information on how to mitigate lead exposure in the home and do a follow up blood test in the future. Can someone describe the protocols/requirements that are supposed to be followed and who is doing it?

I am also curious to know how we've done with children who have a confirmed elevated blood level. If I look at the zip code data we were using last week, there have been more than 100

children who have tested at 5 or above from 2014 Q3 – 2015 Q2. How many of those children have been retested and what is their result?

I would also like to know summary level data for these zip codes for how many children have tested above .14, and what the follow up rates have been for them as well.

I think this would and should be the next question that we are receiving... You identified the issue, you are suggesting a test, filter, flush approach... what about the kids who tested above the threshold?

Nick

## Follow-up for Children in Flint (ZIPs 48501-48507) with Elevated Blood Lead Levels April 2014 through March 2015

### Children with Initial Confirmed (Venous) Elevated BLL 5-14

Children w/BLL 5-14:	43
With retest:	14
Most recent retest was <5:	4
5 to 14:	9
>= 15:	1

### Children with Initial Confirmed (Venous) Elevated BLL >= 15

Children w/BLL >= 15:	3
With retest:	1
Most recent retest was <5:	0
5 to 14:	0
>= 15:	1

---

### Children with Initial Capillary Elevated BLL 5-14 (needing confirmation)

Children w/BLL 5-14:	70
With confirmatory venous:	15
Confirmatory test was <5:	7
5 to 14:	7
>= 15:	1

### Children with Initial Capillary Elevated BLL >= 15 (needing confirmation)

Children w/BLL >= 15:	1
With confirmatory venous:	0

**Subject:** Lead Prevention quarterly reports due soon

Hello all,

Your quarterly report for the 4<sup>th</sup> quarter (July-September) of FY14 is due on October 30. For your convenience, I've attached a copy of the QR form for Prevention.

PLEASE NOTE: You are released from any obligation for FY14 regarding the "Community Prescription," so there is no need to report on that activity this quarter. Development of this document has been a long and arduous process, with a variety of views—all of them with merit—on the best language and format. In the new fiscal year, we'll work together to get it into the hands of providers and the families they serve.

Let me know if you have questions.

Thanks,  
Bob

Robert L. Scott

## Code Enforcement Childhood Lead Poisoning Assessment Tool

Final Version: December 19, 2013

This scorecard is a baseline tool for sparking conversations about improvement opportunities to broaden the number and variety of strategies currently being used to combat childhood lead poisoning in a local community. This scorecard focuses upon code enforcement and related activities that are typically under the control of local municipal government in the state of Michigan.

The scorecard draws upon model programs and approaches from across the nation. With that in mind, it is anticipated that not one Michigan community will be following in every best practice. On the contrary, it is anticipated that many communities will currently be following just a select few of these best practices.

The intent of the scorecard is to measure what is currently being done, pose opportunities for enhancement, and measure positive change over time. By applying the scorecard in 2014 and then using it again in future years, a community's progress towards broadening the strategies deployed to combat childhood lead poisoning can be objectively measured. The goal is not to focus on deficiencies, but to surface opportunity for enhancement.

Measure <sup>1</sup>	Best Practice	Who to ask	Scoring: Evidence of Practice
Education of Property Owners			
Section Score (13 possible points):			
E	<p>Does the municipality educate landlords / property management on their requirements under the U.S. Environmental Protection Agency's (EPA) Renovation, Repair and Painting (RRP) rule when citing code violations for pre-1978 housing?</p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Narrative in code citation notices advising property owners / management where to get more information about the RRP rule, or</li> <li>• Special insert detailing the requirements of the RRP rule, or</li> <li>• Lead-safe work practices are required elsewhere in the code.</li> </ul>	Code Enforcement Supervisor	<input checked="" type="checkbox"/> Yes (3 points) <input type="checkbox"/> No (0 points)
E	<p>Does the municipality educate homeowners on the importance of lead-safe work practices and use of RRP-certified labor when issuing citations to pre-1978 housing?</p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Narrative in code citation notices advising property owners where to get more information about the RRP rule, or</li> <li>• Special insert detailing the requirements of the RRP rule.</li> <li>• LSWP required elsewhere in the code.</li> <li>• Hold proactive workshops for property owners (elsewhere in matrix).</li> </ul>	Code Enforcement Supervisor	<input checked="" type="checkbox"/> Yes (3 points) <input type="checkbox"/> No (0 points)

<sup>1</sup>E = expected, + = enhanced activity, ++ = gold standard

Measure	Best Practice	Who to ask	Scoring: Evidence of Practice
E	<p><b>Does the local Housing Commission fully understand and operationalize its obligations under HUD's Regulation on Controlling Lead-Based Paint Hazards in Housing Receiving Federal Assistance (24 CFR Part 35), specifically as set forth in the September 2000 Interpretive Guidance, Subpart M (Tenant-Based Rental Assistance).</b></p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Housing Quality Standard (HQS) inspections are being conducted at all rented property, AND</li> <li>• Property owners with deficiencies are required to make corrections, AND</li> <li>• Property owners are required to incorporate ongoing lead-based paint maintenance, AND</li> <li>• The Housing Commission works with local public health to match addresses of children with environmental intervention blood lead levels<sup>2</sup> with addresses receiving assistance, AND</li> <li>• Lead hazards are required to be remediated and cleared in all units where a child with an environmental intervention blood lead level resides.</li> </ul>	Housing Commission, Director of Leased Housing	<input type="checkbox"/> Yes (3 points) <input type="checkbox"/> No (0 points)
+	<p><b>Does the municipality holds proactive workshops for property owners to educate them on lead-safe work practices?</b></p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Promotional materials from a workshop</li> </ul>	Code Enforcement Supervisor	<input type="checkbox"/> Yes (2 points) <input checked="" type="checkbox"/> No (0 points)
++	<p><b>Does the local municipality have and enforce a local disclosure law?</b></p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Citation in the municipal ordinance, AND</li> <li>• Staff assigned to enforcement activities.</li> </ul>	City Attorney	<input checked="" type="checkbox"/> Yes (1 points) <input type="checkbox"/> No (0 points)
Upholding RRP Requirements			
Section Score (11 possible points):			
E	<p><b>Does the municipality educate contractors on their requirements under RRP at the time of pulling a building permit for pre-1978 housing?</b></p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Handouts provided to those applying for a building permit, AND</li> <li>• Educational posters visible to the public when visiting the permitting office.</li> </ul>	Building Official	<input type="checkbox"/> Yes (3 points) <input checked="" type="checkbox"/> No (0 points)

<sup>2</sup>Defined by HUD as a blood lead level of 20 µg/dL (micrograms per deciliter) of whole blood or above for a single test, or blood lead levels of 15-19 µg/dL in two tests taken at least three months apart for a child under six years of age.

Measure	Best Practice	Who to ask	Scoring: Evidence of Practice
E	<p><b>Does the municipality require the use of lead-safe work practices in its property maintenance code?</b> (Note, the International Property Maintenance Code (IMC) does not require lead-safe work practices. This would need to be in a supplemental code).</p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Citation in the municipal ordinance.</li> </ul>	Code Enforcement Supervisor	<input type="checkbox"/> Yes (3 points) <input checked="" type="checkbox"/> No (0 points)
+	<p><b>Does the municipality require contractors to be RRP-certified when pulling a building permit for pre-1978 housing?</b></p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Citation in the municipal ordinance, AND</li> <li>• Requirement to provide evidence of certification included on the building permit application.</li> </ul>	Building Official	<input type="checkbox"/> Yes (3 points) <input checked="" type="checkbox"/> No (0 points)
+	<p><b>Does the municipality require that code enforcement and building inspection professionals participate in RRP training?</b></p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• RRP training a requirement included in the job description, or</li> <li>• RRP training requirement included in the employee handbook.</li> <li>• Evidence of training being provided</li> </ul>	Code Enforcement Supervisor, Building Official	<input checked="" type="checkbox"/> Yes (2 points) <input type="checkbox"/> No (0 points)
Registration and Routine Maintenance			
Section Score (23 possible points):			
E	<p><b>Does the municipality require the registration<sup>3</sup> of rental property for all types of rental property</b> (single-families, duplexes, and multi-unit properties)?</p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Citation in the municipal ordinance, AND</li> <li>• List of all registered rental properties.</li> </ul>	<p>Multi-family <input checked="" type="checkbox"/></p> <p>Duplexes <input checked="" type="checkbox"/></p> <p>Single-family <input checked="" type="checkbox"/></p> <p>None <input type="checkbox"/></p> <p>Code Enforcement Supervisor</p>	<input checked="" type="checkbox"/> Yes (3 points) <input type="checkbox"/> No (0 points)

<sup>3</sup> Registration involves informing the municipality in writing that the property will be used for residential rental purposes and usually requires completion of a form calling for contact information and other pertinent information. A fee may or may not be charged for registration. The period for which the registration is valid may range from as little as one year to in perpetuity. Inspections are not required for registration.

Measure	Best Practice	Who to ask	Scoring: Evidence of Practice
E	<p>Does the municipality require the certification<sup>4</sup> of rental property to be in compliance with the property maintenance code at least every four years for all types of rental property (single-families, duplexes, and multi-unit properties)?</p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Citation in the municipal ordinance, AND</li> <li>• List of open enforcement case.</li> </ul>	<p>Code Enforcement Supervisor</p> <p> <input type="checkbox"/> Multi-family  <input type="checkbox"/> Duplexes  <input type="checkbox"/> Single-family  <input type="checkbox"/> None </p>	<p><input checked="" type="checkbox"/> Yes (3 points)  <input type="checkbox"/> No (0 points)</p>
E	<p>Does the municipality have dedicated funding to support code enforcement and rental certification programs? This may include fees to support enforcement.</p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Program budget showing sources of revenue.</li> </ul>	Code Enforcement Supervisor	<p><input checked="" type="checkbox"/> Yes (3 points)  <input type="checkbox"/> No (0 points)</p>
E	<p>Are owners required to address all lead hazards in order to obtain/maintain certification? Or are properties ordered vacated when hazards are not addressed in a timely manner?</p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Citation in the municipal ordinance, AND</li> <li>• List of properties ordered vacated.</li> </ul>	Code Enforcement Supervisor, City Attorney	<p><input type="checkbox"/> Yes (3 points)  <input checked="" type="checkbox"/> No (0 points)</p>
E	<p>Does the municipality use the International Property Maintenance Code (IPMC) or similar code?</p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Citation in the municipal ordinance.</li> </ul>	Code Enforcement Supervisor	<p><input checked="" type="checkbox"/> Yes (3 points)  <input type="checkbox"/> No (0 points)</p>
E	<p>Does the municipality have a supplemental code to address lead hazards not found in the IPMC, such as the lead paint guidance set forth in the National Healthy Housing Standard<sup>5</sup> or a similar ordinance?</p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Citation in the municipal ordinance.</li> </ul>	Code Enforcement Supervisor	<p><input type="checkbox"/> Yes (3 points)  <input checked="" type="checkbox"/> No (0 points)</p>
+	<p>When potential lead hazards are found in a building (visual assessment), does notification go beyond the owner or property management and include the notification of all occupants?</p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>• Documentation of tenant notification in case files.</li> </ul>	Code Enforcement Supervisor	<p><input type="checkbox"/> Yes (2 points)  <input checked="" type="checkbox"/> No (0 points)</p>

<sup>4</sup> Certification involves and inspection of the property to determine if it is in compliance with local codes. A fee is typically charged for certification. The period for which the certification is valid may be no more than six years under current state law (subject to change), and may be less.

<sup>5</sup> The National Healthy Housing Standard is a guidance document jointly prepared by the American Public Health Association and the National Center for Healthy Housing. It will be released in early 2014.

Measure	Best Practice	Who to ask	Scoring: Evidence of Practice
+	<p><b>If lead hazards are found in a building (visual assessment), are all units required to be inspected?</b></p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>Documentation of inspection of all units in case files.</li> </ul>	Code Enforcement Supervisor	<input type="checkbox"/> Yes (2 points) <input checked="" type="checkbox"/> No (0 points)
++	<p><b>Does the municipality require rental property to pass independent lead clearance before issuing rental certification?</b></p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>Citation in the municipal ordinance, AND</li> <li>Documentation in case files for certified rental property.</li> </ul>	Code Enforcement Supervisor	<input type="checkbox"/> Yes (1 points) <input checked="" type="checkbox"/> No (0 points)
<b>Linking Code Enforcement and Lead Hazard Control Programs</b>			
<b>Section Score (8 possible points):</b>			
E	<p><b>Does code enforcement promote and/or coordinate participation in a municipal, county or state lead hazard control program (or a general housing rehabilitation program when dedicated lead hazard control funds are not available)?</b></p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>Promotional materials sent along with code orders, or</li> <li>Language included on code orders promoting programs, or</li> <li>Any other method of informing those receiving citations of the availability of program funds.</li> </ul>	Code Enforcement Supervisor, Housing Rehab Office	<input type="checkbox"/> Yes (3 points) <input checked="" type="checkbox"/> No (0 points)
E	<p><b>Does the local municipality have a lead-safe housing registry or participate in the State's registry?</b></p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>Copy of the registry.</li> </ul>	Housing Rehab Office	<input type="checkbox"/> Yes (3 points) <input checked="" type="checkbox"/> No (0 points)
+	<p><b>Does the municipality have a lead-hazard control program with dedicated (restricted) funding that serves both owners and rental property owners?</b></p> <p><u>Evidence</u></p> <ul style="list-style-type: none"> <li>Program application.</li> </ul>	Housing Rehab Office	<input checked="" type="checkbox"/> Yes (2 points) <input type="checkbox"/> No (0 points)

**Total Score (55 possible points):**

Many of the best practices recommended in this document were initially detailed in the publication "Building Blocks for Primary Prevention - Protecting Children from Lead-Based Paint Hazards" published October 2005 by the Centers for Disease Control and Prevention National Center for Environmental Health - Lead Poisoning Prevention Branch and produced by the Alliance for Healthy Homes.  
[http://www.cdc.gov/nceh/lead/publications/Building\\_Blocks\\_for\\_Primary\\_Prevention.pdf](http://www.cdc.gov/nceh/lead/publications/Building_Blocks_for_Primary_Prevention.pdf)

## **CLPPP PREVENTION Contractor Quarterly Report FY2014**

*Notes: a) The white spaces for reporting will expand as necessary as you type. b) Please save the file with a new name that includes your health department's initials and the FY quarter for this report—e.g. Prevention\_XCHD\_2ndQtr.docx c) Report should be submitted to Robert Scott: scottr9@michigan.gov*

Health department: Genesee County

Quarter: 4th

Requirement 1: Develop a "Community Prescription" that can be used by home visitors, health care providers, and other partners to promote action by parents and point them to community resources, using format supplied by MDCH CLPPP.
The single point of entry concept created through the HUD Lead Hazard Reduction Grant Proposal though not implemented due to not being awarded HUD funds, remains the goal should future funding allow for its implementation.
Requirement 2: Provide presentations at meetings of rental property owner associations, educating them on the dangers of lead poisoning, legal requirements for RPOs, and methods for keeping properties lead safe.
The powerpoint presentation was conducted for the Genesee County Landlords Association in September, with approximately 30 attendees.
Requirement 3: Complete a report card to publicly report the extent to which code enforcement agencies follow best practices with regard to lead inspection activities, using format supplied by MDCH CLPPP (Code Enforcement CLP Assessment Tool.docx).
The City of Flint has completed the Code Enforcement Assessment tool, see attached.
Requirement 4: To the extent that funding will allow, conduct other lead poisoning prevention activities for families with children with elevated blood lead levels (above > 5ug/dL), which may include: a. Providing information on lead safe cleaning methods b. Providing lead safe cleaning supplies/equipment c. Providing direct training and coaching on lead safe cleaning methods d. Conducting lead safe cleaning in the home e. Providing supplies to make temporary fixes to prevent lead poisoning f. Arranging for minor repairs that will prevent lead poisoning, using lead safe
The City of Flint in partnership with the Genesee County Health Department was awarded a \$100,000 Lead Safe for Kids Sake grant and the hope was to pair this with a HUD grant, however due to the lack of HUD funds, the program will be administered as a stand-alone program. The period of performance has not been determined as of the date of this report.
Requirement 5: Participate in quarterly conference calls/webinars. (No report required.)

## **CLPPP PREVENTION Contractor Quarterly Report FY2015**

Notes: a) The white spaces for reporting will expand as necessary as you type. b) Please save the file with a new name that includes your health department's initials and the FY quarter for this report—e.g. Prevention\_XCHD\_2<sup>nd</sup> Qtr.docx c) Report should be submitted to Robert Scott: scott9@michigan.gov

Health department: Genesee

Quarter: 2<sup>nd</sup> Quarter

<p>Requirement 1: Update the "Community Prescription" (CRx) as appropriate. Distribute bounds pads of CRx (50 sheets per pad) to health care providers throughout the focus community, along with guidance regarding its use. To the extent possible, collaborate with Medicaid Health Plans on distribution.</p> <p><i>Report: We are sending out a letter in request for assistance to the local pediatrician's offices in the Flint area, to distribute the prescription. Pads are in progress and should be ready for distribution soon. The department has filled the vacant position that enables the administration of the CLPP grant.</i></p>
<p>Requirement 2: Outreach to Rental Property Owners – Provide presentations at meetings of rental property owner associations, educating them on the dangers of lead poisoning, legal requirements for RPOs, and methods for keeping properties lead safe; AND/OR provide printed educational material or other education to unassociated RPOs/property managers throughout the focus community. To the extent possible, collaborate with local housing authorities, tenants' rights organizations and other community-based organizations to identify and reach RPOs/property managers.</p> <p><i>Report: We are in the process with local organizations to try and capture rental property owners who are not part of the landlords association. We would like to provide a letter and an educational pamphlet to them. We have done a presentation the previous year for the landlords association.</i></p>
<p>Requirement 3: Code Enforcement CLP Assessment Tool – Using the Assessment Tool as guidance, work with code enforcement agencies to bring about best practices with regard to education of property owners, upholding RRP requirements, registration and routine maintenance of rental properties, and linking code enforcement with lead hazard control programs. Update the Assessment Tool as appropriate throughout the contract year.</p> <p><i>Report: Provide more education to rental property owners with the aide of local organizations.</i></p>
<p>Requirement 4: To the extent that funding will allow, conduct other lead poisoning prevention activities for families with children with elevated blood lead levels (above &gt; 5ug/dL), which may include:</p> <ul style="list-style-type: none"> <li>a. Providing information on lead safe cleaning methods</li> <li>b. Providing lead safe cleaning supplies/equipment</li> <li>c. Providing direct training and coaching on lead safe cleaning methods</li> <li>d. Conducting lead safe cleaning in the home</li> <li>e. Providing supplies to make temporary fixes to prevent lead poisoning</li> <li>f. Arranging for minor repairs that will prevent lead poisoning, using lead safe</li> </ul> <p><i>Report: There were not any elevated blood lead cases for this quarter yet. We will distribute information to the families on cleaning and provide cleaning supplies that have been purchased if we should get any in the future.</i></p>
<p>Requirement 5: Participate in quarterly conference calls/webinars. (No report required.)</p>

I've asked our lead epidemiologist to look at the data closer than what was in the charts to get a handle on this. The epi is Cristin Larder.

Hi Nancy,

I do not have Bob's email, so if you can talk to him; however, I got a request from Dr. Hanna-Attisha at Hurley today as to why the 2014-2015 may differ in the 2 pdf's she attached (received 9/15 and 9/25). FYI, she stated that Bob is great to work with.

However, due to different numbers and analyses and such flying around in the last 24 hours, please respond back to me ASAP regarding the discrepancies, and I can relay to her.

Thank you!

Eden

Dr Wells, in regards to the discrepancy noted in state data. Attached are two PDF files that were sent regarding the state lead numbers.

The original PDF was sent on 9/15/15 to Dr Reynolds from Bob Scott from MDHHS's Childhood Lead Poisoning Prevention Program and the updated PDF was sent to me from Bob Scott last Friday.

The attached excel database (that I created) has two tabs that include the original and updated numbers. Yellow highlights are all the numbers that changed. It is very strange how many of the numbers have changed. I'm not sure if the updated numbers tried to refine the location to Flint proper???

The analyses of the data does not change very much (when you look at total annual EBL%) - there has been a statistically significant increase in EBL% since water change (2014-2015) where every year prior there has been a decrease (as has happened nationally). And this does not even include the fact that the data is not scientific – wrong age range and missing lots of EBLs by using first time lead analysis rather than highest lead.

Just thought the discrepancy was odd.

# Elevated Blood Lead Levels in Children Associated With the Flint Drinking Water Crisis: A Spatial Analysis of Risk and Public Health Response

Mona Hanna-Attisha, MD, MPH, Jenny LaChance, MS, Richard Casey Sadler, PhD, and Allison Champney Schnepf, MD

**Objectives.** We analyzed differences in pediatric elevated blood lead level incidence before and after Flint, Michigan, introduced a more corrosive water source into an aging water system without adequate corrosion control.

**Methods.** We reviewed blood lead levels for children younger than 5 years before (2013) and after (2015) water source change in Greater Flint, Michigan. We assessed the percentage of elevated blood lead levels in both time periods, and identified geographical locations through spatial analysis.

**Results.** Incidence of elevated blood lead levels increased from 2.4% to 4.9% ( $P < .05$ ) after water source change, and neighborhoods with the highest water lead levels experienced a 6.6% increase. No significant change was seen outside the city. Geospatial analysis identified disadvantaged neighborhoods as having the greatest elevated blood lead level increases and informed response prioritization during the now-declared public health emergency.

**Conclusions.** The percentage of children with elevated blood lead levels increased after water source change, particularly in socioeconomically disadvantaged neighborhoods. Water is a growing source of childhood lead exposure because of aging infrastructure. (*Am J Public Health*. Published online ahead of print December 21, 2015: e1–e8. doi:10.2105/AJPH.2015.303003)

In April 2014, the postindustrial city of Flint, Michigan, under state-appointed emergency management, changed its water supply from Detroit-supplied Lake Huron water to the Flint River as a temporary measure, awaiting a new pipeline to Lake Huron in 2016. Intended to save money, the change in source water severed a half-century relationship with the Detroit Water and Sewage Department. Shortly after the switch to Flint River water, residents voiced concerns regarding water color, taste, and odor, and various health complaints including skin rashes.<sup>1</sup> Bacteria, including *Escherichia coli*, were detected in the distribution system, resulting in Safe Drinking Water Act violations.<sup>2</sup> Additional disinfection to control bacteria spurred formation of disinfection byproducts including total trihalomethanes, resulting in Safe Drinking Water Act violations for trihalomethane levels.<sup>2</sup>

Water from the Detroit Water and Sewage Department had very low corrosivity for lead as indicated by low chloride, low chloride-to-sulfate mass ratio, and presence of an orthophosphate corrosion inhibitor.<sup>3,4</sup> By contrast, Flint River water had high chloride, high chloride-to-sulfate mass ratio, and no corrosion inhibitor.<sup>5</sup> Switching from Detroit's Lake Huron to Flint River water created a perfect storm for lead leaching into drinking water.<sup>6</sup> The aging Flint water distribution system contains a high

percentage of lead pipes and lead plumbing, with estimates of lead service lines ranging from 10% to 80%.<sup>7</sup> Researchers from Virginia Tech University reported increases in water lead levels (WLLs),<sup>5</sup> but changes in blood lead levels (BLLs) were unknown.

Lead is a potent neurotoxin, and childhood lead poisoning has an impact on many developmental and biological processes, most notably intelligence, behavior, and overall life achievement.<sup>8</sup> With estimated societal costs in the billions,<sup>9–11</sup> lead poisoning has a disproportionate impact on low-income and minority children.<sup>12</sup> When one considers the irreversible, life-altering, costly, and disparate impact of lead exposure, primary prevention is necessary to eliminate exposure.<sup>13</sup>

Historically, the industrial revolution's introduction of lead into a host of products has contributed to a long-running and largely silent pediatric epidemic.<sup>14</sup> With lead now removed from gasoline and paint, the incidence of childhood lead poisoning has decreased.<sup>15</sup> However, lead contamination of drinking water may be increasing because of lead-containing water infrastructures, changes in water sources, and changes in water treatment including disinfectant.<sup>16–18</sup> A soluble metal, lead leaches into drinking water via lead-based plumbing or lead particles that detach from degrading plumbing components. ("Plumbing" is derived from the Latin word for lead,

## ABOUT THE AUTHORS

doi: 10.2105/AJPH.2015.303003

“plumbum.”) Lead was restricted in plumbing material in 1986, but older homes and neighborhoods may still contain lead service lines, lead connections, lead solder, or other lead-based plumbing materials. Lead solubility and particulate release is highly variable and depends on many factors including water softness, temperature, and acidity.<sup>19–21</sup> The US Environmental Protection Agency (EPA) regulates lead in public water supplies under the Safe Drinking Water Act Lead and Copper Rule, which requires action when lead levels reach 15 parts per billion (ppb).

Lead in drinking water is different from lead from other sources, as it disproportionately affects developmentally vulnerable children and pregnant mothers. Children can absorb 40% to 50% of an oral dose of water-soluble lead compared with 3% to 10% for adults.<sup>22</sup> In a dose–response relationship for children aged 1 to 5 years, for every 1-ppb increase in water lead, blood lead increases 35%.<sup>23</sup> The greatest risk of lead in water may be to infants on reconstituted formula. Among infants drinking formula made from tap water at 10 ppb, about 25% would experience a BLL above the Centers for Disease Control and Prevention (CDC) elevated blood lead level (EBLL) of 5 micrograms per deciliter ( $\mu\text{g}/\text{dL}$ ).<sup>24</sup> Tap water may account for more than 85% of total lead exposure among infants consuming reconstituted formula.<sup>25</sup> A known abortifacient, lead has also been implicated in increased fetal deaths and reduced birth weights.<sup>26</sup>

As recommended by the CDC and supported by the American Academy of Pediatrics, blood lead screening is routine for high-risk populations and for children insured by Medicaid at age 1 and 2 years.<sup>27</sup> The CDC-recommended screening ages are based on child development (increased oral–motor behavior), which places a child most at risk for house-based lead exposure (e.g., peeling paint, soil, dust). State and national blood lead–screening programs, however, do not adequately capture the risk of lead in water because infants are at greatest risk.

Armed with reports of elevated WLLs and recognizing the lifelong consequences of lead exposure, our research team sought to analyze blood lead data before (pre) and after (post) the water source switch with

a geographic information system (GIS) to determine lead exposure risk and prioritize responses. This research has immediate public policy, public health, environmental, and socioeconomic implications.

This research includes Flint, Michigan, and surrounding municipalities in Genesee County (Greater Flint). Greater Flint is a postindustrial region of nearly 500 000 people struggling from years of disinvestment by the automobile industry and associated manufacturing activities: the region has lost 77% of its manufacturing employment and 41% of employment overall since 1980.<sup>28</sup> National and local data sources demonstrate dismal indicators for children, especially within Flint city limits.<sup>29–32</sup> Greater Flint ranks toward the bottom of the state in rates of childhood poverty (42% in Flint vs 16.2% in Michigan and 14.8% in the United States), unemployment, violent crime, illicit drug use, domestic violence, preterm births, infant mortality, and overall health outcomes (81st out of 82 Michigan counties).

Greater Flint’s struggles have been amplified by a history of racial discrimination, whereby exclusionary housing practices were common.<sup>33,34</sup> Such attitudes toward integration later precipitated White flight and emboldened home-rule governance,<sup>35,36</sup> causing a massive decline in tax revenue for the city. The declining industrial and residential tax bases strained the city’s ability to provide basic services and reversed the public health fortunes of the city and suburbs.<sup>37</sup> Severely reduced city population densities reduced water demand in the distribution system, exacerbating problems with lead corrosion.

## METHODS

This retrospective study includes all children younger than 5 years who had a BLL processed through the Hurley Medical Center’s laboratory, which runs BLLs for most Genesee County children. The pre time period (before the water source change) was January 1, 2013, to September 15, 2013, and the post time period (after the water source change) was January 1, 2015, to September 15, 2015. The primary study group comprised children living within the city of Flint ( $n = 1473$ ; pre = 736; post = 737) who received water from the city water

system. Children living outside the city where the water source was unchanged served as a comparison group ( $n = 2202$ ; pre = 1210; post = 992).

After institutional review board approval and Health Insurance Portability and Accountability Act waiver, we drew data from the Epic electronic medical record system including BLL, medical record number, date of birth, date of blood draw, full address, sex, and race. For each child, only the highest BLL was maintained in the data set. We coded timing (pre or post) of the BLL on the basis of the date of blood draw. We calculated age at time of blood draw.

We geocoded the data set with a dual-range address locator, and manually confirmed accuracy of geocoded addresses. We conducted a series of spatial joins to assign participant records to Greater Flint municipalities and Flint wards (including those with high WLL), enabling the calculation of the number and percentage of children with EBLLs in each geographic region for both time periods. The reference value for EBLL was 5  $\mu\text{g}/\text{dL}$  or greater. We identified Flint wards with high WLLs with water lead sampling maps.<sup>38</sup> Wards 5, 6, and 7 had the highest WLLs; in each ward, more than 25% of samples had a WLL higher than 15 ppb. We theorized that children living in this combination of wards would have the highest incidence of EBLLs (referred to as “high WLL Flint”; the remainder of Flint was referred to as “lower WLL Flint”).

We derived overall neighborhood-level socioeconomic disadvantage from census block group variables intended to measure material and social deprivation. We calculated these scores from an unweighted  $z$  score sum of rates of lone parenthood, poverty, low educational attainment, and unemployment (adapted from Pampalon et al.<sup>39</sup>; used previously in Flint by Sadler et al.<sup>40</sup>), and assigned these to each child on the basis of home address. Positive values denote higher disadvantage, and negative values denote lower disadvantage. Table 1 highlights the overall socioeconomic disadvantage score comparison by time period and area.

We created spatial references for EBLL risk and a predictive surface for BLL by using GIS, providing the ability to see otherwise invisible spatial–temporal patterns in environmental exposure.<sup>17</sup> Because of the need to

**TABLE 1—Demographic Comparison of the Time Periods Before (Pre) and After (Post) Water Source Change From Detroit-Supplied Lake Huron Water To the Flint River, by Area: Flint, MI, 2013 and 2015**

Characteristic	Outside Flint		All Flint		High WLL Flint		Lower WLL Flint

Note. WLL = water lead level. No statistically significant differences were found in any pre–post value within any of the 4 geographical areas.

understand spatial variations and geographically target resources, we also ran ordinary Kriging with a spherical semivariogram model on the entire data set for Greater Flint, allowing interpolation of associated BLL risks with lead in water. Previous methods for evaluating spatial variation in lead levels have ranged from multivariable analyses at the individual level<sup>41</sup> to interpolation methods such as inverse distance weighting<sup>42</sup> and Kriging.<sup>43</sup> Given our assumption that lead risk is spatially correlated in Greater Flint because of the age and condition of pipes, interpolation methods are appropriate for building a preliminary risk surface. Both inverse distance weighting and Kriging derive such surfaces by calculating values at unmeasured locations based on weighting nearby measured values more strongly than distant values.<sup>44</sup> Whereas inverse distance weighting is a deterministic procedure and relies on predetermined mathematical formulae, Kriging has the added sophistication of using geostatistical models that consider spatial autocorrelation, thereby improving accuracy of prediction surfaces (ArcGIS Desktop version 10.3, Environmental Systems Research Institute, Redlands, CA). As well, Kriging can be run with relatively few input points: adequate ranges fall between 30 and 100 total points, although Kriging has been conducted with just 7.<sup>44</sup>

Our city of Flint sample included 736 children in the pre period and 737 children in the post period, which amounts to a

density of approximately 22 points per square mile. Kriging has become an increasingly common method for measuring variations in soil lead, and is given more in-depth treatment elsewhere.<sup>45</sup> To examine change in proportion of children with EBLL from the pre to post time periods, we used  $\chi^2$  analysis with continuity correction for each area (outside Flint, all Flint, high WLL Flint, and lower WLL Flint). In addition, we examined differences in overall socioeconomic disadvantage scores from the pre to post time periods by using the independent *t* test. Finally, we used both  $\chi^2$  analysis with continuity correction and 1-way ANOVA to assess demographic differences by area. We used post hoc least significant difference analysis following statistically significant 1-way ANOVAs.

## RESULTS

We uncovered a statistically significant increase in the proportion of Flint children with EBLL from the pre period to the proportion of Flint children in the post period. In the pre period, 2.4% of children in Flint had an EBLL; in the post period, 4.9% of children had an EBLL ( $P < .05$ ). By comparison, outside of Flint water, the change in EBLL was not statistically significant (0.7% to 1.2%;  $P > .05$ ). In high WLL Flint, EBLL increased from 4.0% to 10.6% ( $P < .05$ ). Figure 1 shows the EBLL percentage change per area.

Results of the GIS analyses show significant clustering of EBLLs within the Flint city limits. According to ordinary Kriging, Figure 2 shows a predicted surface based on observations of actual child BLL geocoded to home address to visualize BLL variation over space (measured in  $\mu\text{g}/\text{dL}$ ). The darkest shades of red represent the highest risk for EBLL based on existing observations. Outside Flint, the entire county falls entirely within the lowest half of the range (in shades of blue); the only locations where predicted BLL is greater than 1.75  $\mu\text{g}/\text{dL}$  is within Flint city limits.

Within Figure 2, each ward is also labeled according to the percentage of water samples that exceeded 15 ppb. The areas with the highest WLLs strongly coincide with the areas with the highest predicted BLLs. In addition, the high percentage of EBLL in wards 5, 6, and 7 also correspond with the high WLLs in wards 5, 6, and 7 (the labels in Figure 2). Table 2 shows ward-specific WLLs, pre period and post period EBLL percentages, and predicted BLL and predicted change in BLL from Kriging.

Areas experiencing the highest predicted BLL in the post period (Figure 2) are generally also areas with greatest change in predicted BLL (measured in  $\mu\text{g}/\text{dL}$ ) when compared with the pre period (Table 2; Figure A, available as a supplement to the online version of this article at <http://www.ajph.org>). Figure A quantifies this rate of change with a green to red scale: large increases are shown in increasingly darker shades of red, whereas large decreases are shown in increasingly darker shades of green. These once again match with city wards that experienced greater rates of EBLL percentage increase (Figure 1, Table 2). In wards 5 and 6 (which experienced a predicted 0.51 and 0.27  $\mu\text{g}/\text{dL}$  increase, respectively), the EBLL percentage more than tripled. In ward 5, the EBLL percentage increased from 4.9% to 15.7% ( $P < .05$ ). The area of intersection between wards 3, 4, and 5 (in the east side of the city) also appeared high in the Kriging analysis of Figure 2, and with a different unit of aggregation this neighborhood would also exhibit a significant increase in EBLL percentage. Ward 7 had high pre period and post period EBLL percentage levels above 5% (with a particularly high rate in the western portion of the ward). Citywide,

Note. WLL = water lead level.

\* $P < .05$ .

**FIGURE 1—Comparison of Elevated Blood Lead Level Percentage, Before (Pre) and After (Post) Water Source Change From Detroit-Supplied Lake Huron Water to the Flint River, Flint, MI, 2013 and 2015**

4 wards (1, 4, 7, and 9) experienced decreases in predicted BLL, 3 wards (2, 5, and 6) experienced large increases, and 2 wards (3 and 8) remained largely the same (Figure A).

Overall, statistically significant differences exist between the areas examined (outside Flint, high WLL Flint, and lower WLL Flint) in all demographic characteristics except sex. The overall percentage of African American children is 24.4% outside Flint, compared with 76.8% in high WLL Flint and 67.0% in lower WLL Flint ( $P < .001$ ). Children outside Flint were younger (mean = 1.86 years [SD = 1.10]) than high WLL Flint (mean = 2.04 years [SD = 1.02]) and lower WLL Flint (mean = 2.09 years [SD = 1.07];  $P < .001$ ). Differences in overall socioeconomic disadvantage scores are likewise significant ( $P < .001$ ). Post hoc least significant difference analysis shows statistically significant differences for overall socioeconomic disadvantage between outside Flint and high WLL Flint ( $P < .001$ ), between outside Flint and lower WLL Flint ( $P < .001$ ), and between high WLL Flint and lower WLL Flint ( $P < .001$ ).

## DISCUSSION

Our findings reveal a striking increase in the percentage of Flint children with EBLL

when we considered identical seasons before and after the water source switch, with no statistically significant increase in EBLL outside Flint. The spatial and statistical analyses highlight the greatest EBLL increase within certain wards of Flint, which correspond to the areas of elevated WLLs.

A review of alternative sources of lead exposure reveals no other potential environmental confounders during the same time period. Demolition projects by the Genesee County Land Bank Authority (Heidi Phaneuf, written communication, October 29, 2015) showed no spatial relationship to the areas of increased EBLL rates. As well, no known new lead-producing factories nor changes in indoor lead remediation programs were implemented during the study period. Although Flint has a significant automobile history, the historical location of potentially lead-using manufacturing (e.g., battery plants, paint and pigment storage, production plants) do not align with current exposures.

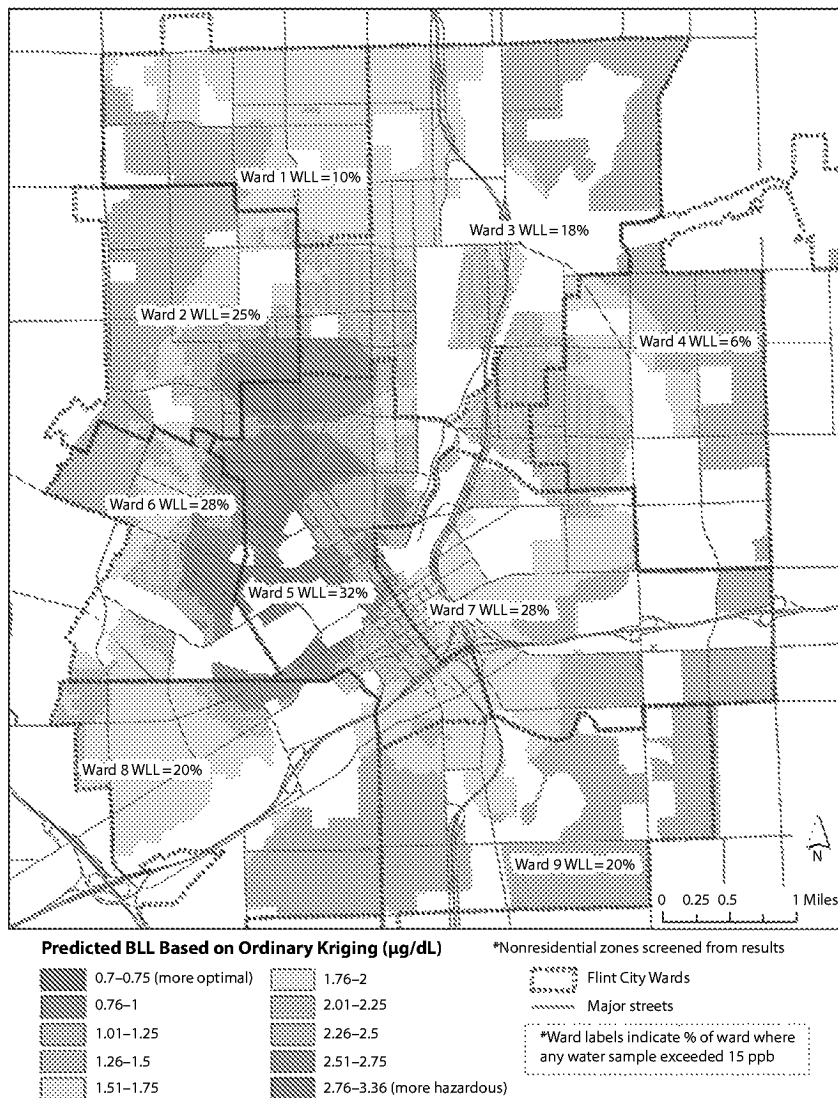

Because there was no known alternative source for increased lead exposure during this time period, the geospatial WLL results, the innate corrosive properties of Flint River water, and, most importantly, the lack of corrosion control, our findings strongly implicate the water source change as the

probable cause for the dramatic increase in EBLL percentage.

As in many urban areas with high levels of socioeconomic disadvantage and minority populations,<sup>46</sup> we found a preexisting disparity in lead poisoning. In our pre water source switch data, the EBLL percentage in Flint was 2.4% compared with 0.7% outside Flint. This disparity widened with a post water source switch Flint EBLL of 4.8%, with no change in socioeconomic or demographic variables (Table 1). Flint children already suffer from risk factors that innately increase their lead exposure: poor nutrition, concentrated poverty, and older housing stock. With limited protective measures, such as low rates of breastfeeding,<sup>47,48</sup> and scarce resources for water alternatives, lead in water further exacerbates preexisting risk factors. Increased lead-poisoning rates have profound implications for the life course potential of an entire cohort of Flint children already rattled with toxic stress contributors (e.g., poverty, violence, unemployment, food insecurity). This is particularly troublesome in light of recent findings of the epigenetic effects of lead exposure on one's grandchildren.<sup>49</sup>

The Kriging analysis showed the highest predicted BLLs within the city along a wide swath north and west of downtown. This area has seen significant demographic change, an increase in poverty, and an increase in vacant properties, especially over the past 25 years (Richard Sadler, written communication, October 5, 2015). Higher BLLs were also predicted northeast of downtown and in other older neighborhoods where poverty and vacancy rates have been high for many decades. Significantly, the biggest changes in predicted BLL since 2013 were also found in these impoverished neighborhoods; more stable neighborhoods in the far north and south of the city may have experienced improved predicted BLLs because of prevention efforts taken by the more-often middle-class residents in response to the water source change. Of considerable interest is that the areas shown as having the best public health indices by Board and Dunsmore in Figure 2 of their 1948 article<sup>37</sup> are virtually identical to the areas with the worst lead levels today.

After our preliminary zip code-based findings (pre to post water source switch

Note. BLL = blood lead level; WLL = water lead level.

**FIGURE 2—Predicted Surface of Child Blood Lead Level and Ward-Specific Elevated Water Lead Level After (Post) Water Source Change From Detroit-Supplied Lake Huron Water to the Flint River, Flint, MI, 2015**

EBLL = 2.1% to 4.0%;  $P < .05$ ) were shared at a press conference,<sup>50</sup> the City of Flint and the Genesee County Health Department released health advisories,<sup>51</sup> and the county health department subsequently declared a public health emergency.<sup>52</sup> Shortly after, the State of Michigan released an action plan with short- and long-term solutions focusing on additional sampling, filter distribution, and corrosion control.<sup>53</sup> One week later, Michigan's governor revealed WLLs in 3 schools to be in the toxic range with 1 school showing a water lead level of

101 ppb, almost 7 times the level that requires remediation.<sup>54</sup> A \$12 million plan to reconnect to Detroit's water source was announced.<sup>54</sup>

We undertook our current spatial analytic approach to overcome limitations of zip code boundaries and to develop a more thorough understanding of specific areas in Flint where EBLL risk is more severe (post office addresses often do not align with municipal boundaries in Michigan, and one third of Flint mailing addresses are not in the city of Flint). This spatial analysis is

valuable for understanding subneighborhood patterns in EBLL risk because aggregation by zip code or ward minimizes the richness of spatial variation and creates artificial barriers that may obscure hot spots (as in the confluence of wards 3, 4, and 5).

Such use of spatial analysis for estimating lead exposure risk has been used to target blood lead-screening programs. In our case, in addition to identifying areas of risk, spatial analysis helps guide municipal and nongovernmental relief efforts aimed at identifying vulnerable populations in specific neighborhoods for priority distribution of resources (e.g., bottled water, filters, pre-mixed formula).

### Limitations

Our research contains a few limitations. First, we may have underestimated water-based lead exposure. Our sample included all children younger than 5 years with blood lead screening, although the greatest risk from lead in water is in utero and during infancy when lead screening is not done. If lead screening were recommended at a younger age (e.g., 6 or 9 months) for children who live in homes with potential lead piping or lead service lines, more children with EBLL from water could be identified, although state and national comparison rates would be lacking. Second, lead screening is not completed for all children. It is mandated by Medicaid and CDC-recommended for other high-risk groups; such data may be skewed toward higher-risk children and thus overestimate EBLL, especially in non-high-risk areas. Third, the underserved population of Flint has significant housing instability: lead levels may reflect previous environmental exposure, and exposure often cannot be adequately estimated on the basis of current residence alone.<sup>55</sup>

Fourth, although large, our sample does not reflect all lead screening from Flint. We estimate that our data capture approximately 60% to 70% of the Michigan Childhood Lead Poisoning Prevention Program data for Flint. Annual data released from this program further support our findings, revealing an annual decrease in EBLL percentage from May to April 2010 to 2011 until the same period in 2013 to 2014 (4.1%,

**TABLE 2—Ward-Based Comparison of Observed and Predicted Water Lead Level Percentages, Before (Pre) and After (Post) Water Source Change From Detroit-Supplied Lake Huron Water to the Flint River, Flint, MI, 2013 and 2015**

Ward	WLL % > 15 ppb	Pre EBLL%	Post EBLL%	Predicted Post BLL <sup>a</sup>	Change in Predicted BLL From Pre to Post, µg/dL
1	10	0.0	2.8	1.4	-0.10

<sup>a</sup>Ordinary Kriging geostatistical analysis.

<sup>b</sup>Indicates wards defined as high WLL risk in this study.

3.3%, 2.7%, 2.2%, respectively<sup>56</sup>; Robert L. Scott, e-mail correspondence, September 25, 2015). Following the water switch in April 2014, the 4-year declining trend (as seen nationally) reversed with an annual EBLL of 3.0%.

We found consistent results (with control for age and methodology) when we analyzed Michigan Childhood Lead Poisoning Prevention Program data for both high WLL Flint (EBLL percentage increased: 6.6% to 9.6%) and outside Flint (EBLL percentage remained virtually unchanged: 2.2% to 2.3%). Our institution-processed laboratory blood lead tests, however, had an even greater proportion of children with EBLLs versus state data in the post period. This may reflect that the BLLs processed at Hurley Medical Center, the region's only safety-net public hospital, represent a patient population most at risk with limited resources to afford tap water alternatives.

## Conclusions and Future Research

Future research directions include conducting more detailed geospatial analyses of lead service-line locations with locations of elevated BLLs and WLLs; repeating identical spatial and statistical analyses in the same time period in 2016 reflecting changes associated with the health advisory

and return to Lake Huron source water; analyzing feeding type (breastfed or reconstituted formula) for children with EBLLs; analyzing cord blood lead of Flint newborns compared with non-Flint newborns; and conducting water lead testing from homes of children with EBLLs.

A once celebrated cost-cutting move for an economically distressed city, the water source change has now wrought untold economic, population health, and geopolitical burdens. With unchecked lead exposure for more than 18 months, it is fortunate that the duration was not longer (as was the case in Washington, DC's lead-in-water issue).<sup>16</sup> Even so, the Flint drinking water crisis is a dramatic failure of primary prevention. The legal safeguards and regulating bodies designed to protect vulnerable populations from preventable lead exposure failed.

The Lead and Copper Rule requires water utilities to notify the state of a water source or treatment change recognizing that such changes can unintentionally have an impact on the system's corrosion control.<sup>57</sup> Although a review is required before implementing changes, the scope of risk assessment is not specified and is subject to misinterpretation. In response to the Flint drinking water crisis, the EPA recently released a memo reiterating and clarifying the need for states to conduct corrosion

control reviews before implementing changes.<sup>58</sup> This recommendation is especially relevant for communities with aging infrastructure, usurped city governance, and minimal water utility capacity; in such situations, there is an increased need for state and federal expertise and oversight to support decisions that protect population health.

Through vigilant public health efforts, lead exposure has fallen dramatically over the past 30 years.<sup>13</sup> With the increasing recognition that no identifiable BLL is safe and without deleterious and irreversible health outcomes,<sup>13</sup> *Healthy People 2020* identified the elimination of EBLLs and underlying disparities in lead exposure as a goal.<sup>59</sup> Regrettably, our research reveals that the potentially increasing threat of lead in drinking water may dampen the significant strides in childhood lead-prevention efforts. As our aging water infrastructures continue to decay, and as communities across the nation struggle with finances and water supply sources, the situation in Flint, Michigan, may be a harbinger for future safe drinking-water challenges. Ironically, even when one is surrounded by the Great Lakes, safe drinking water is not a guarantee. 

## CONTRIBUTORS

M. Hanna-Attisha originated the study, developed methods, interpreted analysis, and contributed to the writing of the article. J. LaChance and R. Casey Sadler assisted with the development of the methods, analyzed results, interpreted the findings, and contributed to the writing of the article. A. Champney Schnepf assisted with the interpretation of the findings and contributed to the writing of the article.

## ACKNOWLEDGMENTS

We would like to thank Marc Edwards, PhD, and Elin Betanzo, MS, for their expert assistance with understanding the historical and scientific background of lead in water.

## HUMAN PARTICIPANT PROTECTION

This study was reviewed and approved by Hurley Medical Center institutional review board.

**Importance:** High

Hello – I'm going to send a series of emails with materials you have asked for, as a way to organize them.

The first document attached to this email is our CLPPP updated analysis of the blood lead testing data we have for children aged 0-16 in Flint. This is an update from what we sent to the Director's office earlier in the year, in that we added an additional year (2010-2011), and added data for May-August 2015 (per Geralyn's request in an email late last week).

Regarding this data:

- We are using the timeframe of May –April for this chart, because the water source change in Flint happened in April 2014. So, we started by looking at the 12 month time period from May 2014 – April 2015. Then we went back and compared that same time frame to the 4 previous years, to see if the pattern was similar, significantly different, etc.
- We included all children with a Flint address, which may not exactly conform to the city boundaries.
- We only included first time blood lead levels of  $\geq 5$  mcg/dL, not all subsequent tests a child may have received.
- We included all types of blood samples – venous blood draws, capillary samples, or unknown (e.g. not labeled as venous or capillary). Typically we would point to venous samples as the best, most reliable, but we had many non-venous samples, so to be inclusive added those in.

Looking at the charts, you can definitely see the seasonal impact associated with lead poisoning.

We do NOT see a different pattern of results for the 2014-2015 year, right after the change in water source. That year looks more like the data from 10-11, and 11-12.

For the full 5 years worth of data, testing rates were pretty consistent, so we don't think that is driving the data. However, note that testing levels for May-August 2015 appear to be lower than in the previous 5 years.

The second document I have attached is a presentation sent to us this morning by Dr. Mona Hanna-Attisha, from Hurley Medical Center. She shared this related to her data request that she sent to our program. In scanning it, we noted that

she is using different data than we did (by age, by zip code, time frames, which years she included, etc.), so comparing our data chart to her results is like comparing apples and oranges. We have not run any analyses using her parameters. We did note some slides in her document that we might disagree with, for example her statement that water is the primary source of lead (in Michigan, it remains lead paint that is our primary source of lead exposure).

Please let us know if you have questions you have about the data charts we produced. Next email will be some of our program materials, that may be of use in the upcoming outreach effort. Also, Rashmi indicated who I should include on this email, and I trust you will share with others as appropriate.

Nancy

# PEDIATRIC LEAD EXPOSURE IN FLINT, MICHIGAN: A FAILURE OF PRIMARY PREVENTION

---

Mona Hanna-Attisha MD MPH FAAP

Hurley Children's Hospital

Michigan State University Department of  
Pediatrics and Human Development

# Introducing Makayla\*

- 12 month old girl (DOB 8/15/2014) presented last week for her 1 year old check up. No concerns.
- Lives with single mom and 2 older siblings in west side (48504). Formula from WIC; powder mixed with warm tap water.
- Physical exam and development are normal. Makayla receives her 1 year old vaccines and routine lead and hemoglobin screening.
- *A couple days later, lead level comes back as 6 ug/dL.*

\*Hypothetical scenario

# Blood lead level of 6 ug/dL....

- Blood lead levels (BLL) above 5 ug/dL are considered elevated blood lead levels (EBL)
- Just a few years ago (2012), 10 ug/dL was cutoff
- Increasing evidence shows NO safe blood lead level
- Disproportionately impacts low income, minority children
- Primary prevention is most important

# Primary Prevention

- “Because no measurable level of blood lead is known to be without deleterious effects, and because once engendered, the effects appear to be irreversible in the absence of any other interventions, public health, environmental and housing policies should encourage **PREVENTION** of all exposure to lead.”

“Low Level Lead Exposure Harms Children: A Renewed Call for Primary Prevention.”  
2012 CDC Advisory Committee on Childhood Lead Poisoning Prevention.

# What will happen to Makayla?

- Vast evidence supports increased likelihood of:
  - Decrease in IQ
    - An increase in BLL from 1 to 4 ug/dL, drops mean IQ -3.7 points
  - Small change in mean IQ, shifts entire population IQ distribution
    - Reduces high achievers IQs (>130) and increases kids with low IQs (<70)
    - Implications for special education services, employment, incarceration, life achievement, etc

Lanphear BP et al., Low-level environmental lead exposure and children's intellectual function: an international pooled analysis. Environ Health Perspect, 2005. 113:894-9.

Fewtrell LJ, Pruss-Ustun A, Landrigan P, and Ayuso-Mateos JL, Estimating the global burden of disease of mild mental retardation and cardiovascular diseases from environmental lead exposure. Environmental Research, 2004. 94:120-33.

# Behavioral Burden

- Increased likelihood of :
  - ADHD behaviors
  - Delinquent behaviors and arrests
  - Total arrests and increased rates of arrests involving violent offenses
  - Other health effects: hematologic, cardiovascular, immunologic, endocrine, etc

Wright, JP, KN Dietrich, MD Ris, et al. 2008. Association of prenatal and childhood blood lead concentrations with criminal arrests in early adulthood. *PLoS Med* 5(5): e101

Chen, A, B Cai, KN Dietrich, et al. 2007. Lead exposure, IQ, and behavior in urban 5-7 year-olds: Does lead affect behavior only by lowering IQ? *Pediatrics* 119(3): e650-e658.

Needleman, HL, C McFarland, RB Ness, et al. 2002. Bone lead levels in adjudicated delinquents: A case control study. *Neurotoxicology and Teratology* 24(6):711-717.

# The Cost

- “For childhood lead poisoning, \$5.9 million in medical care costs, as well as an additional \$50.9 billion (sensitivity analysis: \$44.8–\$60.6 billion) in lost economic productivity resulting from reduced cognitive potential from preventable childhood lead exposure.”
- “The present value of Michigan’s economic losses attributable to lead exposure in the 2009 cohort of 5 year-olds ranges from \$3.19 (using U.S. blood lead levels) to \$4.85 billion (using Michigan blood lead levels) per year in loss of future lifetime earnings.”

Leonardo Trasande and Yinghua Liu. Reducing The Staggering Costs Of Environmental Disease In Children, Estimated At \$76.6 Billion In 2008. *Health Affairs*, 30, no.5 (2011):863-870

The Price of Pollution: Cost Estimates of Environment-Related Childhood Diseases in Michigan. 2010 Report by Michigan Network of Children’s Environmental Health

# Lead in Water

- Increasing as source of lead, because of success in controlling other sources.
- Increasing due to aging water infrastructures, change in water sources, disinfectant uses, etc
- Disproportionally impacts developmentally-vulnerable formula-fed infants and pregnant mothers
  - For about 25% of infants drinking formula made from tap water at 10 ppb, blood lead would rise above the CDC level of concern of 5 micrograms/deciLiter (or ug/dL).
  - Increase in fetal death and reduced birth weights

Triantafyllidou, S., Gallagher, D. and Edwards, M. Assessing risk with increasingly stringent public health goals: the case of water lead and blood lead in children. *Journal of Water and Health*. doi: 10.2166/wh.2013.067 58-68 (2014).

Edwards, M. Fetal Death and Reduced Birth Rates Associated with Exposure to Lead-Contaminated Drinking Water. *Env. Sci. and Tech.* 2013 DOI: 10.1021/es4034952

# PRELIMINARY RESULTS

---

# Preliminary Results of Pediatric Blood Lead Levels (BLL)

## • **Methods**

- Data from all blood lead levels processed at Hurley Medical Center
- HMC Institutional Review Board (IRB) approved
- All children 5 years of age and younger
- Zip codes 48501-48507
- Two periods of comparison:
  - PRE-SWITCH: January 1, 2013 – September 15, 2013
  - POST-SWITCH: January 1, 2015 – September 15, 2015
- Analyzed % Elevated Blood Lead (EBL)
  - EBL = Blood lead Levels > 5 g/dL

# Blood Lead Level Analysis

- Large sample size
  - N= 1746 for Flint children (pre n=906, post n=840)
  - N= 1670 for non-Flint children (pre n=943, post n=727)

## Flint results for children 5 years and under:

PRE-SWITCH % EBL: 2.1% (consistent with MDHHS data 2.2)

POST-SWITCH % EBL: 4.0%

**$p < 0.05$ ; STATISTICALLY SIGNIFICANT CHANGE**

# High Risk Zip Codes Results

- Focus on zip codes (48503 and 48504) with high water lead levels
- Total n=742, pre n=394, post n=348
- Results:
  - PRE-SWITCH % EBL: **2.5%**
  - POST-SWITCH % EBL: **6.3%**
  - **p < 0.05; STATISTICALLY SIGNIFICANT CHANGE**

# What was rest of county doing?

- Analysis of same time periods for Genesee County children who live outside of City of Flint zip codes (non 48501-48507)
  - N=1670 for non-Flint children (pre n=943, post n=727)

Non-Flint results for children 5 years and under:

PRE-SWITCH % EBL: 0.6%

POST-SWITCH % EBL: 1.0%

**p = 0.637; NO CHANGE**

# Blood Lead Level Analysis

- \* % EBL all children less than 5 years of age

	ALL FLINT (n=1746)	HIGH- RISK FLINT (n=742)	REST OF FLINT (n=1004)	NON- FLINT (n=1670)
<b>PRE-SWITCH</b>	<b>2.1%</b>	<b>2.5%</b>	<b>1.8%</b>	<b>0.6%</b>
<b>POST-SWITCH</b>	<b>4.0%</b>	<b>6.3%</b>	<b>2.4%</b>	<b>1.0%</b>

# Blood Lead Level Analysis

- % EBL children 15 months or less
  - Total Flint n=619, pre n=295, post n=324
  - Total Non-Flint n=816, pre n=443, post n=376

	HIGH-RISK FLINT (n=269)	REST OF FLINT (n=350)	NON- FLINT (n=816)
<b>PRE-SWITCH</b>	<b>1.5%</b>	<b>0.6%</b>	<b>0.5%</b>
<b>POST-SWITCH</b>	<b>4.4%</b>	<b>1.1%</b>	<b>0.5%</b>

# Graphical Summary

## Change in % EBL Flint vs Non-Flint

# Graphical Summary

## Change in % EBL by area

# Conclusions from BLL analysis

- % of children with EBL in Flint has increased
  - Most striking increase in zip codes with highest water lead levels
- Results underestimate risk: infants not screened for lead and water usage unknown.
  - *Accurate exposure largely unknown since national childhood lead screening focuses on household lead exposure (paint, soil, dust) at later ages (1 and 2 yrs)*
- Results are consistent and concerning. Primary prevention has failed.

# Next Steps

- Immediately limit further exposure
  - Encourage breast feeding
  - No tap water for high risk groups: infants on formula & pregnant mothers
  - Declare health advisory: allows WIC to administer water or ready-to-feed formula and other resources (Salvation Army & United Way water supplies)
  - Distribution of lead clearing NSF-approved filters
  - Public education regarding precautions (flushing, etc)
  - Re-connect to Lake Huron water source ASAP

# And Makayla...

- Asymptomatic now
- But what will her future hold and an entire generation of Flint children?

**To:** Dykema, Linda D. (DHHS) <[DykemaL@michigan.gov](mailto:DykemaL@michigan.gov)>  
**Cc:** Stanbury, Martha (DHHS) <[stanburym@michigan.gov](mailto:stanburym@michigan.gov)>; Scott, Robert L. (DHHS) <[ScottR9@michigan.gov](mailto:ScottR9@michigan.gov)>  
**Subject:** RE: PDF map of flint

If the observations are geocoded to the street address, I would be uncomfortable sharing it as part of a public presentation except under three options:

- 1) The "point" is randomized. That can be done and still preserve clustering, which is what I think the county wants to show. The map label can indicate that the locations have been adjusted for confidentiality purposes. Someone on the fifth floor could help with randomization if needed.
- 2) Have attendees sign a confidentiality agreement but that is not going to be possible if there are more than a handful in the audience.
- 3) Show the map for a limited amount of time but attendees are not provided a hard copy and the map is not posted on a web site.

It helps that the data cover multiple years.

Option 1 is preferred for a public presentation. Option 3 is also doable. If the presentation is just to health department staff I don't see a problem in presenting the information as is.

Subject: RE: PDF map of flint

If the observations are geocoded to the street address, I would be uncomfortable sharing it as part of a public presentation except under three options:

- 1) The "point" is randomized. That can be done and still preserve clustering, which is what I think the county wants to show. The map label can indicate that the locations have been adjusted for confidentiality purposes. Someone on the fifth floor could help with randomization if needed.
- 2) Have attendees sign a confidentiality agreement but that is not going to be possible if there are more than a handful in the audience.
- 3) Show the map for a limited amount of time but attendees are not provided a hard copy and the map is not posted on a web site.

It helps that the data cover multiple years.

Option 1 is preferred for a public presentation. Option 3 is also doable. If the presentation is just to health department staff I don't see a problem in presenting the information as is.

**Subject:** UPDATE: Flint map randomization

Martha and Bob,

Attached is a new map of EBL cases in Flint randomized by a method used by Ed Hartwick. It's better than the previous map I generated where cases were scattered at random throughout the city. In the revised map, cases were shifted slightly from their original point so some of the clustering still holds up. This is probably the final map that GCHD could use for their presentation.

Let me know if you have any questions or if you want to discuss.

Thank you,  
Junaid

**To:** Stanbury, Martha (DHHS) <stanburym@michigan.gov>; Scott, Robert L. (DHHS) <ScottR9@michigan.gov>  
**Subject:** Flint map with randomized points

Martha and Bob,

Attached is the map of Flint with points randomized by zip code, meaning I calculated the # of cases with BLL between 5 and 9 ug/dL (inclusive) and with BLL  $\geq 10$  ug/dL for each zip code and plotted the same number of cases per zip code in random locations within the zip code boundary. Unfortunately, as we originally suspected, the clustering of cases depicted in the original map (also attached) is lost with this randomization.

Junaid

**Subject:** RE: Flint Water

I agree—plans can view lead info in MCIR, but it's not the most efficient way to get plan-wide lead data.

In answer to Eden's question below: new lead data becomes available in the Warehouse and MCIR at the same time—generally each Monday morning.

We've been anticipating the need for a weekly file to Medicaid health plans. Daisy Peng helped me with a Warehouse query that identifies the health plan (if applicable) for each new lead result.

Ps. The plans would need to look child-by-child in the MCIR. They can accumulate names as they look them up but having Bob provide them a weekly file is going to be easier for them.

Sue and Dr. Wells - see below and attached. We wanted to share what UnitedHealth is doing in Flint. Thought you may find this a helpful example of what our health plan partners are implementing after our discussions. We will be following up with the other plans shortly and will pass along what we get from them too. If there is anything in here that is concerning, please let us know.

The L letter to all providers in Flint, which was sent to you both for sign off, will be going today. I also understand that we have a plan on metrics/data reporting too.

Please let us know if there is anything else Medicaid can do to be helpful.

Happy New Year!

Chris

Subject: Flint Water Concerns

Chris,

In recognition of the need for an all-hands-on-deck response to the Flint Water concerns, I want to share with you the UnitedHealthcare Community Plan outline (attached) for how we will address the identification, outreach, education, and care coordination for our members in the Flint area. Critical to such efforts is coordinating care with primary care providers (PCPs) where possible, working with other agencies, and keeping our message consistent with the public health leaders at MDHHS and Genesee County Health Department.

We will convey the public health messages regarding water testing, free water filters, and dietary choices that reduce lead absorption. It is also important to communicate with the Genesee County Health Department for those children at higher risk to arrange nurse home visits to evaluate and specifically educate families. We will follow-up and coordinate with PCPs to follow blood levels and respond accordingly.

We will leverage our current relationships with the local health department, primary care providers, and our CSHCS care managers to make sure that we complete an effective outreach, education, and care coordination. Though our current membership in the Flint area is small, we expect that with the new contract, it will grow and we are prepared to continue to assist this growing customer base as they come on board.

All of this is consistent with our broader efforts for the health of our member population.

Thanks,

Brian

**Attachments:** MI BLL5 map 2014.pdf; MI BLL5 map 2014.tif

Emily,

Please see attached map as pdf and tiff.

20% of children less than six years of age were tested for lead poisoning in CY2014.  
Of those tested, 5058 children were identified with blood lead levels  $\geq 5$  ug/dL (3.5%).

Please let me know if you need anything else, or if you want any changes to the map, or exported in a different format.

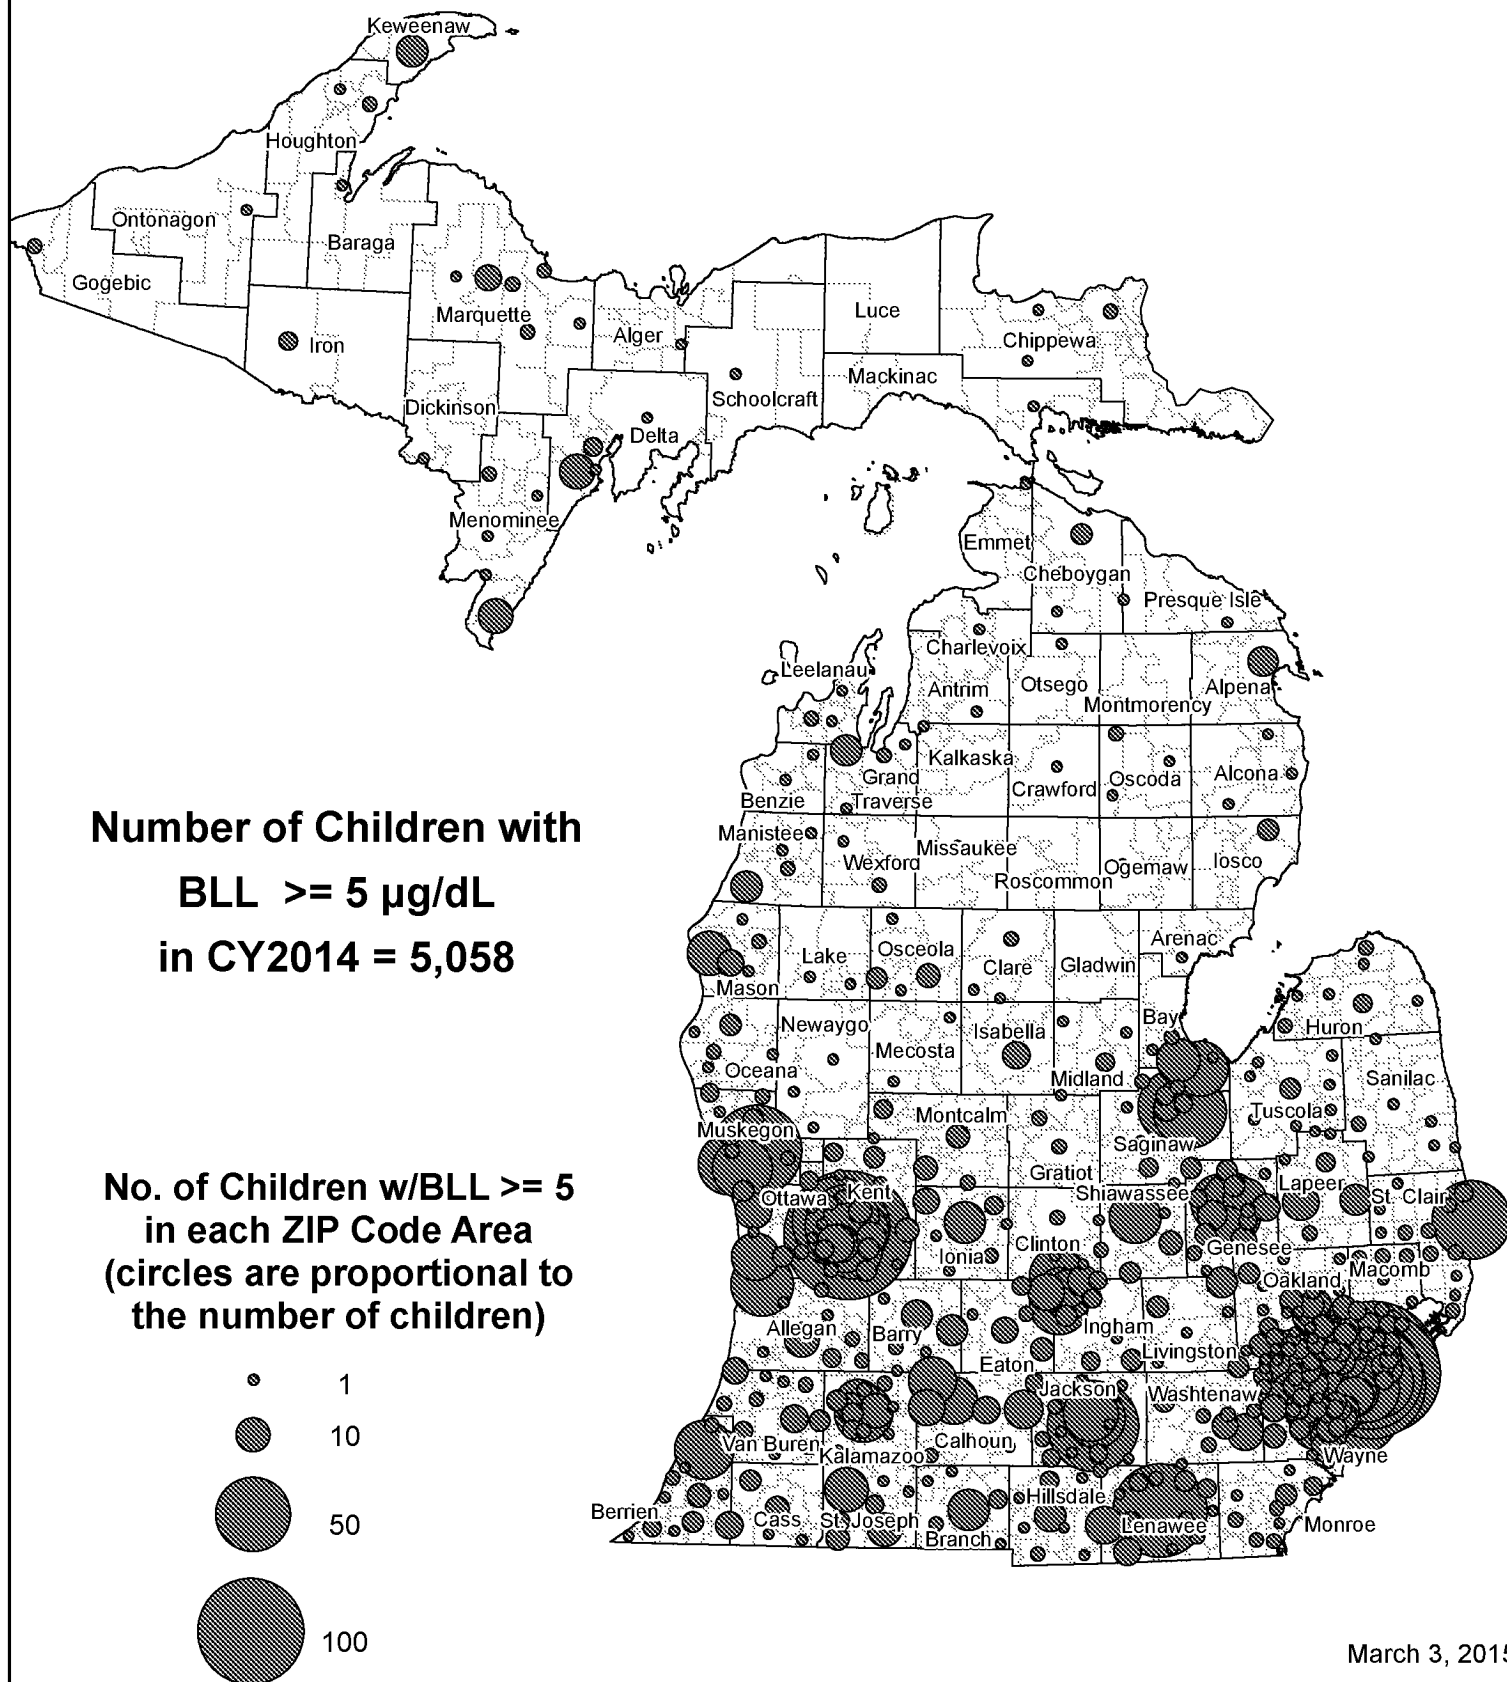

Bob

**Attachments:** 2014 Annual BLL report preliminary 020915.pdf; CLPPP 2013 Data Report.pdf

Monica,

Please see attached for 2014 and 2013. The three previous years' annual reports are available on our website: [www.michigan.gov/lead](http://www.michigan.gov/lead) Click on Policy & Research, then click on Data and Research.

Let me know if you have questions.

Bob

**Sent:** Monday, May 18, 2015 10:29 AM  
**To:** Scott, Robert L. (DCH)  
**Subject:** Lead testing levels for oakland county

Can you send me the lead testing levels for Oakland County's 1-2 year olds? If you have the last five years that would be great.

Thanks so much,

Mó

Hi Bob,

If you aren't able to give us the final data by Thursday, may we please have the preliminary data?

Thank you!

Best,

Alanna

I might have given her preliminary 2014 data, don't remember for sure. I don't think I've described any 2014 data as "final" yet.

Hi Bob,

At a meeting yesterday with Regina Royan from DHWP she said that she had the 2014 EBL numbers, I just wanted to verify that they aren't out yet.

Thanks!

Best,

Alanna

Yes. I won't have a complete annual data report by then, but can get you a FINAL county-plus-Detroit spreadsheet.

Hi Bob,

We were hoping to do an update on 2014 EBL numbers at the next GHHI meeting on 6/25. Is there any chance that you'll have them ready before then?

Thank you!

Best,

Alanna

Hi Bob,

We were hoping to do an update on 2014 EBL numbers at the next GHHI meeting on 6/25. Is there any chance that you'll have them ready before then?

Thank you!

Best,

Alanna

Alanna,

I hope to work on that this week. Will send them ASAP.

Bob

Hi Bob!

If you have the 2014 EBL numbers could you please send them to me?

Thank you!

Best,

Alanna

Pam,

Please see attached for the latest 2014 data, which can be considered "final." It hasn't been made into a complete data report, or distributed widely—still trying to get there.

Bob

**Subject:** Re: Childhood Blood Lead Levels

Greetings Bob,

Can you tell me if these are the most up-to-date and accurate figures for Saginaw County/Saginaw City:

<b>Childhood Blood Lead Level (BLL)(Percentage)<sup>2</sup></b>	<b>2014</b>	<b>Target</b>
Children ≥ 5 years old Tested for BLL	3,668 (26.1%)	
Children ≥ 5 years with BLL ≥ 10 µg/dL	13 (0.35%)	0**
Children ≥ 5 years with BLL ≥ 5 µg/dL	121 (3.3%)	

This data is needed for our Saginaw County Community Health Improvement Planning work. Thanks.

Hi Bob,

I wanted to check in to see if there is any updated (2014) Data Reports on Blood Lead Levels. We use some of the information from these reports in our presentations, and I just wanted to make sure we had the most recent information that is available.

I appreciate any direction you can provide. Thanks!

I didn't get an attachment. We use the data for 12 cities -- all but Benton Harbor and Hamtramck.

Paul,

I apologize for letting the target date slip by. I think I can work on them now, will try to have them to you by the end of this week. Please see attached—do you need all of those cities, or are you looking for specific ones?

Thanks,  
Bob

Bob,  
Could you estimate when the files will be ready?  
Thanks.

**Subject:** Medicaid Lead Testing reports

Hi Bob,

Attached are the annual reports you have been sending us. Could you please send the 2014 versions? June 19 would be a good target date.

Thank you.

**Attachments:** 2014 Lead Testing and EBLL 0-5 072015.pdf; 2014 Lead Testing and EBLL 1-2 072015.pdf; 2014 Medicaid 072015.pdf

Alanna,

Please see three attached files. I've been working on some of the pieces and parts for 2014. Communities and ZIPs to follow later today.

We are trying to put together a snazzy, user-friendly Annual Data Report, but it may be a while yet.

Please note that despite my assurance that the spreadsheet I sent before GHHI was "final," the attached spreadsheet for kids age 0-5 is in fact slightly different. We discussed "confirmed" the other day, and decided we should stick to our long-standing policy that only a venous test can "confirm" an elevated blood lead level. In the version I sent you earlier, I was including (for the first time) two elevated capillary tests as "confirmed," which boosted the numbers just slightly.

Bob

Hi Bob,

I hope that you had a wonderful weekend. Any word on when the final report for 2014 EBLs will be out?

Thanks!

Best,

Alanna

Hi again Bob,

Do you have the numbers for children under six with 5-9 EBLs from 1998-2003? If so, could you please send them to me?

Thank you!

Best,

Alanna

Hi Bob,

We were hoping to do an update on 2014 EBL numbers at the next GHHI meeting on 6/25. Is there any chance that you'll have them ready before then?

Thank you!

Best,

Alanna

Alanna,

Here is Communities (attached). ZIP Codes will have to wait a bit, sorry.

Bob

Hi Bob,

I hope that you had a wonderful weekend. Any word on when the final report for 2014 EBLs will be out?

Thanks!

Best,

Alanna

Hi again Bob,

Do you have the numbers for children under six with 5-9 EBLs from 1998-2003? If so, could you please send them to me?

Thank you!

Best,

Alanna

Hi Bob,

We were hoping to do an update on 2014 EBL numbers at the next GHHI meeting on 6/25. Is there any chance that you'll have them ready before then?

Thank you!

Best,

Alanna

**Sent:** Wednesday, July 22, 2015 12:43 PM  
**To:** Scott, Robert L. (DCH)  
**Subject:** RE: Medicaid Lead Testing reports

Thanks for the explanation. That's what I was afraid of, since we use both the single year results and have a trend file on the national Data Center.  
At least we're used to it; seems like most of our indicators have explanatory notes.

---

**From:** Scott, Robert L. (DCH) [mailto:ScottR9@michigan.gov]  
**Sent:** Wednesday, July 22, 2015 10:43 AM  
**To:** Paul Diefenbach  
**Subject:** RE: Medicaid Lead Testing reports

It's a sticky one. We felt we needed to make the change to "confirmed" after we took a closer look at our data--even at the 5-9 levels so many capillary tests are followed by a lower venous test, so including all 5-9s (cap and venous) is misleading. On the other hand, that creates a precipitous drop in the number of kids with BIL >=5, so I provided the old version (confirmed and unconfirmed) for comparison with previous years.

So, my suggestion is this: when displaying 2014 numbers only, use the "confirmed" columns. When comparing against previous years, use the "confirmed & unconfirmed" columns. Of course this creates potential for lots of confusion, so some explanatory notes might be appropriate.

**To:** Scott, Robert L. (DCH)  
**Subject:** RE: Medicaid Lead Testing reports

I do have a question, now that I am processing the data.

There are now confirmed and unconfirmed counts of >5 ug/dL. Which one should I use?

**To:** Peeler, Nancy (DCH)  
**Subject:** FW: Flint Testing and EBLLs.xlsx

Nancy,

I said this morning I'd look to see if the distribution of EBLLs in the July-September 2014 "spike" was any different from the typical distribution of EBLLs in Flint. I compared totals by zip code vs totals by zip code from 2010 (BLLs >=5). The pattern is very similar and is further evidence, I think, that the water was not a major factor here.

A	B	C	D
July-September 2010			
zip	# of EBLL		
48503	11	16 % of total	
48504	17	24 % of total	
48505	19	27 % of total	
48506	11	16 % of total	
48507	8	11 % of total	
48532	4	6 % of total	
Total	70	100 % of total	
CY 2010			
zip	# of EBLL		
48503	68	21 % of total	
48504	88	27 % of total	
48505	79	24 % of total	
48506	50	15 % of total	
48507	30	9 % of total	
48532	11	3 % of total	
Total	326	100 % of total	

Cristin is redoing her analysis with the extra two years of data. I assume it's OK to let her go ahead with that.

Bob

**Subject:** RE: Flint Testing and EBLLs.xlsx

Okay, thanks, Bob. I'll incorporate the previous years and put the new results into a publisher document with some description of what's going on in the chart.

We'll find out if this changes the results!

**Subject:** RE: Flint Testing and EBLLs.xlsx

Cristin,

I can safely say I don't understand it without some explanation.

However, late yesterday Nancy and I decided to take a look two years farther back to see how they fit with the recent years. Please see attached, which I just finished this morning. Sorry I didn't have this for you yesterday before you did the analysis. Would this new information change the analysis?

Thanks,  
Bob

Nancy and Bob,

Is the control chart clear enough, do you think? I could whip up a fact sheet with a description of what it shows, if you think it would help make it more digestible for our audience.

Hi Nancy,

I made a p-chart, which Shewhart's version of a control chart for proportions, for the data you sent. Basically, I used the monthly data from 2013-14 to create upper and lower control limits, then plotted the 2014-15 data in a run chart. It shows that the three months in question are the only ones that lie outside the control limit: in fact, they are the only points that lie well above the mean at all. This doesn't say anything about causality, but it does warrant further investigation.

There are several next steps we can employ if the folks upstairs ask us to look deeper into the data. Also, I'm not sure if you talked at all with the Environmental Health folks, but their toxicologists could probably help give us some context to the issue.

Hi Cristin and Patti –

This is the CLPPP data for Flint that I had mentioned to you last week. Cristin, can you quickly run any tests to see if the difference in the first graph is statistically significant? Bob is at his desk today, best to connect with him if you have questions about the data. We are hoping to send this up today, so we appreciate anything you can do to get us a response this afternoon, if at all possible. Many thanks!

Nancy

**Subject:** Michigan Healthy Homes & Lead Poisoning Prevention Data

Hi Robert,

My name is Amanda Reed and I work at United Way for Southeastern Michigan in Early Childhood Education. I was reading about the work the Healthy Homes & Lead Poisoning Prevention program has done, and I noticed the most recent data on the MDCH website is from 2012. **Is there updated information that is available on lead poisoning statistics in Michigan for children? Also, do these reports have different age segments for children (0-1 years, 1-2 years, etc.)?**

Any information you can provide would be much appreciated. We are looking to create a snapshot of how lead poisoning may be correlated with developmental outcomes of children in our region.

Thank you, and I look forward to hearing from you,

**Amanda Reed**

The CDC's and Michigan's "reference level" for blood lead is 5 ug/dL—with the understanding that there is no safe level of lead.

Ps- Is 5 or 10 the cut off lead ?

On Wed, Sep 16, 2015 at 10:30 AM, Lawrence Reynolds <[lrey52@gmail.com](mailto:lrey52@gmail.com)> wrote:

Good morning Mr. Scott .

Thank you for your timely response.I have reviewed the graphs with our GCHD and Dr. Mona Hanna-Attisha of Hurley.Is it possible to stratify the data by age -under 15 months, 16 months to under 6 years of age , over 6 years.Also can we get the most recent data for 2015.

At this point we will work with our patients to educate them.

Breast feeding is first choice .

I understand different filters do different things for lead , and not all get lead clumps from leaching pipes so we will not emphasize them.

We will try to get WIC to cover bottled water and encourage using water from outside the city system

Our goal is to give the most consistent correct information.

Are there any plans for public service announcements from the state ?

I am asking you to cc my [reynolds@mottchc.org](mailto:reynolds@mottchc.org) email along with lrey52@ gmail so I can access from anywhere.

Thanks. Will do today.

Are you able to look at EBL % as was previously done for the more recent months and for kids less than 5yr?

Mona,

I'll be happy to help with this. We'll need you to submit a DCH-1294 Data Use Agreement (attached) and an IRB Initial Review Application - Abbreviated for review by the MDHHS IRB. The latter is available at [Michigan.gov/irb](http://Michigan.gov/irb) under "Information for New Applications." (The "Abbreviated" application is used whenever another IRB has already approved

the project.) Please complete each of the two documents as far as you can, and send to me unsigned, as Word documents. I'll fill in the rest, and will send the DUA to our Legal department and the IRB app to our IRB contact. I'll ask each of them for as quick a review as possible.

Please let me know if you have questions.

Bob

Bob, I just received IRB approval to look at the City of Flint blood lead levels. I would love to get the raw data if that is possible. Attached is my study proposal and the IRB approval.

Specific fields that we are looking for include:

MCIR ID or some sort of identifier to ensure first time lead level only Zip code Date of Birth Date of Blood lead level Lead level

Would greatly appreciate your assistance! Thanks!

Nancy,

Dr. Hanna-Attisha poked me again this morning about getting the updated charts. Can I send her what I gave you late yesterday, or do you want me to hold off?

Bob

Subject: Flint

Based on questions coming through, I do think we need to run our Flint charts for the same population group that the Flint docs ran (as close as we can approximate the sample) but I'd look at it across the 5 years again.

Depending on what our charts show, we may want to consider having Epi help us run an analysis more like the docs ran - but let's look at the revised charts as a starting point.

## Blood Lead Testing of Children in Flint, Before and After the Change in Flint's Water

- The change in Flint's water source occurred in April 2014. MDHHS looked at children's blood lead levels (BLL) before and after this event.
- The dark blue line (May 2014 – April 2015) and the green line (May-August 2015) reflect children's blood lead tests after the change. All other lines reflect tests before the change.
- An increase in childhood lead poisoning in summer (July, August, September) is typical throughout Michigan every year.
- While there is a dramatic difference between the numbers of elevated BLL in the summer before and after the event, a wider look that includes data back to 2010 shows that the year BEFORE the event (the yellow line) was more of an anomaly than the year after (the dark blue line).

\*This graph includes:

Children whose address is listed as "Flint"--may not conform exactly to Flint city limits

Children less than 16 years of age at time of test

Only first-time blood lead levels  $\geq 5$  ug/dL

All first-time elevated levels, regardless of sample type (venous, capillary or unknown)

## Blood Lead Testing of Children in Flint, Before and After the Change in Flint's Water

- Blood lead testing (regardless of elevated levels) also tends to rise during late summer (August, September, October).
- This graph shows that testing in Flint has remained fairly steady over the last five years, except for a recent decline (May – August 2015).

\*This graph includes:

Children whose address is listed as "Flint"--may not conform exactly to Flint city limits

Children less than 16 years of age at time of test

The number of children tested within each month.

Some children are tested more than once, and may be included in more than one month or year.

Only thought - should we say that if results were being driven by the water supply, we would expect the rate to remain at a higher rate?

Also, I forgot this earlier, probably too in the weeds - Larry Reynolds kept mentioning MCIR data - I don't think they know what our data source is that we use. Should we add any kind of a talking point that says all data included in this analysis is reported directly from labs to MDHHS, in accordance with state law?

If you think it worth adding those, go ahead, and send on to Jennifer. Thanks!

**Attachments:** Attempt to replicate Hurley.xlsx

Nancy,

Thought I'd pester you one more time. I'm sure this one is not for the public. It's my attempt to recreate Hurley #s. I included EBL @ 5 & 6 just for comparison, but also looked at Venous-only vs. All types. I used children 0-5 and zip codes 48501-48507 just as Hurley did. I found a difference between the two years, but not as much difference as they did. For some reason I found more children tested than they did.

Let me know if you think it's worth pursuing any farther.

Thanks,  
Bob

No, I didn't run the data for kids 0-5. We normally would use that age range, and I don't completely recall the conversation that led to using 0-15—possibly trying to cast as wide a net as possible? Of tests for kids 0-15, approximately 10% are for the 6-15 age range.

Bob, did you ever look at your data that was released for kids less than 5, rather than 16? 16 seems so strange – we rarely do lead levels in kids over the age of 5. Is that what other states do?

Thanks!

Mona,

There's generally a lag of about two weeks from the date of the test to its being fully processed in our system. A few results take longer, for a variety of reasons. 99% of all results through August should be reflected in those numbers. Not sure why the last few months were so low.

Thanks,  
Bob

Thanks Bob. We greatly appreciate all your assistance and your hard work!

It's interesting to note that the number of children tested in July and August of 2015 is so small as compared to the same months in previous years? Do you think those numbers capture all the tests that were done -- is there a lag time in reporting to your system?

Thanks! Mona

Marc,

As you well know, the data you and Dr. Hanna-Attisha have requested are derived from personal health data, which of course is confidential. There are state and federal laws governing what can be shared, and how, with researchers or the public.

I worked with you earlier this month to get data to you relatively quickly, but we did not manage to complete the process before I went on annual leave for several days. I neglected to inform you that I'd be away. I returned on Wednesday and corresponded that day with Dr. Hanna-Attisha, providing her with the forms she'll need for her request.

Regarding your email from Monday, I think you'll be able to get approval for data with zip code identified. I'll edit your data use agreement accordingly, will adjust it to say "limited data set" instead of "de-identified," and will re-submit it to our Legal office. You will need to submit an MDHHS IRB review application (attached) because this is considered research. You should also submit a "HIPAA Waiver Request" (attached). (I wasn't aware of the Waiver Request when we talked earlier this month.) Send those documents to me, and I'll pass them on to our IRB contact. I don't know whether you'll need to go through an IRB review with your institution.

In short, both your request and Dr. Hanna-Attisha's are in process in accordance with departmental policies.

I've attached a PDF that includes the numbers behind the graphs you referred to, and I'm CC'ing Dr. Hanna-Attisha so that she has it as well.

Please keep in mind that I work for a very small program responsible for processing several thousand blood lead results every week--in order to get them out to the professionals working directly with children and families, which is the primary purpose and highest priority of our program.

Bob

Dear Robert,

I just spoke to this young researcher at Hurley, and apparently, she has been unable to get access to the state blood lead records.

I have to say, it is very disturbing that the state keeps issuing these blood lead reports and statements in their press releases, and refuses to share the data backing them up with outside researchers.

Even worse, state reps are running around claiming that these reports are proof that Flint water is safe to drink.

Can you tell me why it is so difficult to get this data, and why your agency is raising so many obstacles to sharing it with everyone who asks? I note that I have been asking to see your data since MDEQ first sent it to reporters back in August, and I count 10 e-mails that I sent responding to all your questions. As of yet, you have given me nothing in response. Yet you have been sending reporters one report after another. It seems your agency is more interested in public relations than sound science.

In the meantime, can I at least be given the numbers of EBL cases and number of tests each month, that are the basis for the latest graph your agency is sending to the press...or is that top secret as well?

Marc

# Children with Elevated Blood Lead Levels in Genesee County, by ZIP Code Area

5-year period: September 1, 2010 - August 31, 2015

## Children in Genesee County, Tested for Lead Poisoning, by Blood Lead Level

### Most Recent 12-Month Period: September 1, 2014 - August 31, 2015

	0 - 4 ug/dL	5 - 14 ug/dL Confirmed*	5 - 14 ug/dL Not Confirmed*	15 - 44 ug/dL Confirmed*	15 - 44 ug/dL Not Confirmed*	>= 45 ug/dL
Flint ZIPS (48501-48507)	2,721	49	53	5	**	0
Genesee County (all ZIPs)	6,086	58	94	6	**	0

### Most Recent Five-Year Period: September 1, 2010 - August 31, 2015

	0 - 4 ug/dL	5 - 14 ug/dL Confirmed*	5 - 14 ug/dL Not Confirmed*	15 - 44 ug/dL Confirmed*	15 - 44 ug/dL Not Confirmed*	>= 45 ug/dL
Flint ZIPS (48501-48507)	11,596	287	219	24	**	0
Genesee County (all ZIPs)	26,362	359	415	29	9	0

\*One test per child is included in each table: the highest venous result, or if no venous, then the highest capillary result.

Only venous tests are considered to be "confirmed."

\*\*Supressed (N<5)

Nancy,

Please see attached. I don't have anything in there at this point about follow-up activities. Rereading the email from Mr. Lyon, I'm not sure it's required. He refers to "follow up rates" in the third paragraph, but based on the first two, I think he means rates of follow-up testing.

At any rate, I haven't found much in HHPSS so far—only one event for a letter sent by Sherry, encouraging a confirmatory venous test. I left a phone message with her. I talked with Dawn Hallwood, director of EH, who indicated Sherry makes some calls of families of children with EBL--but I'm pretty sure that means she doesn't make visits. Dawn says GCHD does not do any EBL Investigations, but they try to get families into the Lead Safe Home Program to get them an investigation that way.

Thanks,  
Bob

Nancy and Karen,

Please see attached. Any suggestions for changes? Column order? Sorting? General appearance? Different fields of information?

These lists do not display children whose next test is not currently due, or whose level has fallen below 5. But I'm keeping everyone on a Master List that I will update each week. (Nobody drops off the Master List.)

SUMMARY:	
# of children needing confirmation (BLL 5-14):	79
# of children needing confirmation (BLL >= 15):	0
# of confirmed cases needing retesting (BLL 5-14):	66
# of confirmed cases needing retesting (BLL >= 15):	7
# of confirmed cases, not currently due for retest:	6
# of children with most recent BLL <5:	8
Total:	166

The map is going to be used in a Presentation that Toni is giving to a community partner, CHAP. So yes it is an audience outside of the health dept.

**To:** Taylor, Sherry  
**Subject:** RE: 2014 lead

Sherry,

Can you tell me what the map will be used for? If it will stay internal to GCHD, no problem. But if you're planning to display it to an outside audience, there may be a problem regarding confidentiality. (Even though the map will be similar to last year's, there is more and more attention to what goes out these days.)

Thanks,  
Bob

No, I don't have an update, but I can do it. The 2009-2013 covers five years. Do you want the update to show 2010-2014, to keep the five-year thing?

**Subject:** RE: 2014 lead

Thank you Bob,

This is just what I was looking for! Do you happen to have an update of the map of kids tested in Flint area with elevated blood lead levels from 2009 to 2013? It is not something we need today. It is dated 7/23/2014

Thank you

Sherry,

I have posted an updated file to your MIBLOODLEAD 112 area of DCH-File Transfer. Sorry it's so late in the day this time.

I have included children ages 6-17 who had EBLIs since April 2014, but I put them on a second tab. If a child started on the list at age 5, and is now 6 years old, that child is still on the first tab.

I've also included more columns this time than I have previously. I wanted to show you everything we have for this file. I'll be on the Tuesday call tomorrow, so if you want me to hide some of those columns, you can let me know.

Thanks,  
Bob

Dear Eden

My apologies if this is duplication. You had asked for percent testing positive for children under age 6 for City of Flint zip codes after the switch for a zip code map.

On Oct 5, 2015, at 8:52 AM, Lyon, Nick (DHHS) <[LyonN2@michigan.gov](mailto:LyonN2@michigan.gov)> wrote:

So, I have a process question: If a child tests above 5 micg/dl, the suggested protocol is to provide information on how to mitigate lead exposure in the home and do a follow up blood test in the future. Can someone describe the protocols/requirements that are supposed to be followed and who is doing it?

I am also curious to know how we've done with children who have a confirmed elevated blood level. If I look at the zip code data we were using last week, there have been more than 100 children who have tested at 5 or above from 2014 Q3 – 2015 Q2. How many of those children have been retested and what is their result?

I would also like to know summary level data for these zip codes for how many children have tested above .14, and what the follow up rates have been for them as well.

I think this would and should be the next question that we are receiving... You identified the issue, you are suggesting a test, filter, flush approach... what about the kids who tested above the threshold?

Nick

**Subject:** Updated Timeline  
**Attachments:** Timeline 12 30 15.docx

Linda—this is the MDHHS Flint Water timeline, compiled from information discussed during our internal team meeting. The timeline is current through 12-30-15. The most recent update references the provider letter distributed by Medicaid on 12-30-15 -- Blood Lead Guidelines to Address the City of Flint Residents' Potential Exposure to Lead.

At this point, I think it makes sense for your area to be the "keeper of the timeline" and ensure that it is kept up to date, and maintain version control. Let me know if you have any questions.

Sue

## Flint Water: Timeline of Key Events

### 1 PRE JULY 2015

---

- Fall 2014 – Genesee County Health Department (GCHD) identified increase in cases of Legionella; MDHHS assisted GCHD in Epidemiologic analysis
- January 2015: MDHHS assisted with case interviews
- 6-4-15 Final Legionellosis outbreak report sent to Genesee County Health Department and discussed with Centers for Disease Control and Prevention. There were 45 cases laboratory confirmed cases of legionella. Healthcare-associated Legionella was suspected for a subset of cases. Results demonstrated that over half (27/45) of the cases had a healthcare facility exposure in the two weeks prior to their illness onset. In response, the healthcare facility has implemented multiple environmental and procedural measures to alleviate the situation.
  - The source of water at the primary residence was evaluated for all cases. Twenty-one of 45 (47%) cases occurred in people whose residence received City of Flint water. Of the 18 persons that did not report healthcare visits, 8 (44%) were exposed to Flint water at their home.
  - Ten cases had no exposure to a Flint hospital in the 2 weeks prior to illness nor were their homes on the Flint water system.
  - Other possible exposures were evaluated and no other known community exposures were identified.
  - Enhanced surveillance has continued for the remainder of 2015.
- 2-26-2015 - (2 calls) initiated by LeAnn Walters. Contacted Childhood Lead Poisoning Prevention Program-CLPPP (Karen Lishinski) – Ms. Walters expressed concern about Flint water quality and provider refusing to test her children; during second call she related that provider agreed to testing
- 3-4-2015 - (1 call) LeAnn Walters contacted CLPPP because child had elevated blood lead level; city officials wouldn't talk to her about her water; Karen provided EPA contact information

### 2 JULY 2015

---

- 7-22-15 Contact from Mark Johnson U.S. Agency for Toxic Substances and Disease Registry (ATSDR) to L. Dykema regarding Flint drinking water status; asking if Environmental Health was engaged
- 7-23-15 Director office inquiry forwarded to Population Health Administration for review/response
- 7-23-15 Division of Environmental Health (Dykema) contacted DEQ for update on drinking water testing/status. S. Busch relates that city in compliance with lead copper rule; one house with high lead level in water was an anomaly as house was connected to old water main but had since been corrected. This home was the residence of LeAnne Walters from 3-4-15 calls.

- 7-24-15 Childhood Lead Poisoning Prevention Program (CLPPP) requests assistance from Epidemiology to assess magnitude of change in 2014 Blood Lead Levels (in children) for city of Flint
  - Results indicate percentage of Elevated Blood Lead Levels (EBLs) for summer 2014, followed seasonal trends and the levels showed decrease by October. Further analysis would be needed to establish causation.
- 7-28-15 Response sent to Director's office

### 3 AUGUST 2015

---

- 8-4-15 Meeting with Governor's office and Flint pastors. Flint pastors had information provided to Director in response to 7-23-15 inquiry
- 8-6-15 Informal request from Liane Shekter Smith (DEQ) to Kory Groetsch MDHHS-Division of Environmental Health (DEH) after a meeting (unrelated to Flint situation) to assist with health education regarding lead in drinking water. MDHHS-DEH-supervisor made aware of request.
- 8-24-15 Dr. Mona Hanna Attisha contacts Genesee County Health Department for Blood Lead Level data/information
- 8-31-15 DEH staff meet to discuss communication plan for Flint/DEQ per request from DEQ

### 4 SEPTEMBER 2015

---

- 9-2-15 Marc Edwards contacts Bob Scott regarding Flint BLL data
- 9-8-15 Dr. Mona Hanna Attisha contacts CLPPP ( K. Lishinski) regarding BLL data
- 9-9-15 Email sent from Dr. Mona Hanna Attisha to CLPPP (K. Lishinski) requesting the BLL data
- 9-11-15 DEH/DEQ conference call regarding draft communication plan; overview.
- 9-15-15 B. Scott responds to Dr. Larry Reynolds, provides chart
- 9-16-15 Dr. Mona Hanna Attisha emailed B. Scott requesting the MCIR (BLL) data
- 9-16-15 Dr. Mona Hanna Attisha contacts Senator Ananich regarding data request
- 9-22-15 Senator Ananich spoke with Director Lyon regarding Dr. Mona Hanna Attisha's data request and Flint water situation
- 9-22-15 DEQ communications office contacted DHHS communications (A. Minicucci) about Healthy Homes Program
- 9-22-15 MDHHS receives copy of Dr. Mona Hanna Attisha's presentation to be presented at upcoming press event
- 9-23-15 MDHHS WIC office receives an inquiry about availability of bottled water through the WIC program. (Per federal regulations, clients can use SNAP benefits to purchase water, but water is not an allowable food item for purchase under the WIC program).
- 9-24-15 Hurley Press Event
- 9-24-15 Director requests response to Flint water situation
- 9-24-15 Bureau of Epidemiology begins analysis of Flint zip code data utilizing the Poisson Regression for statistical analysis
- 9-25-15 MDHHS responds to Detroit Free Press reporter inquiries

- 9/28/2015 Mark Valacak-Genesee County Health Department Health Officer- contacted M. Miller regarding timeframe for completion of MDHHS data analysis
- 9-29-15 Dr. Eden Wells contacts Dr. Mona Hanna Attisha regarding her study results
- 9-30-15 Briefing to Director comparing Lead Copper Rule Testing and Marc Edwards protocol.

## 5 OCTOBER 2015

---

- 10-1-15 MDHHS provides information for Flint Water website, including the following documents: Parent Handbook: Is Your Child Safe From Lead Poisoning, Blood Lead Level (BLL) Quick Reference for Primary Care Providers, Lead Screening & Testing for Safe, Healthy Michigan Kids, and finally, Pregnant and Nursing Mothers: What You Need to Know
- 10-2-15 Governor's press conference-MDHHS study results consistent with Hurley findings
- 10-2-15 State Budget Office approval to use carryover emergency funds and transfer of DEQ funds to purchase water filters
- 10-2-15 R.Travis and S. Bien received an inquiry about what Michigan is doing regarding the Flint lead water situation from Jacquelyn Schneider, Deputy Director and Policy Director of US Senate Committee on Agriculture, Nutrition, & Forestry. Ms. Schneider inquired about the availability of Ready -to -Feed formula and asked if we are confident that the water filters that are being provided are sufficient to address the concerns about lead.
- 10-5-15 Filter distribution planning meeting held in Flint with local organizations
- 10-5-15 A teleconference was held with Rashmi Travis, Nancy Peeler, Dr. Eden Wells, Bob Scott, Corinne Miller, Sarah LyonCallo, Patti McKane (MDHSS), and Dr. Mona Hanna-Attisha, Jenny Latanz, and Dr. Richard Sandler (Hurley Lead Research Team) to discuss the nuances of the raw data that was sent on 10-2-15 to the Hurley Research Team.
- 10-5-15 S. Bien provided a response to Jaclyn Schneider indicating the following: that we are in regular contact with the local health department, the majority of WIC clients were already using bottled water to reconstitute infant formula, that a mass distribution (about 4000 filters) of filters was underway, and lead testing was being done adjunct with WIC clinics, and the local health department had additional lead testing opportunities scheduled.
- 10-5-15 MDHHS announces water filters will be available to the public on Oct. 6
- 10-6-15 MDHHS announces extended hours for filter distribution, updates Parent Handout on Flint Water website
- 10-7-15 Flint Mayor's Water Technical Advisory Committee meeting (E. Wells, L. Dykema); recommends switch back to Detroit Water Authority
- 10-8-15 GCHD issues Public Health Advisory
- 10-12-15 Daily calls with GCHD begin. Topics Include:
  - Distribution and tracking of filters
  - Development and implementation of case management in Flint by GCHD
  - Development and implementation of lead environmental inspection contract
  - Development and distribution of educational materials – to providers and parents
  - Testing events (blood lead)
  - Testing events (water mainly / DEQ activity in the schools)

- Data analysis (internal meeting)
- 10-13-15 MDEQ/MDHHS/toxic steering group committee meeting discusses use of the Integrated Exposure Update Biokinetic (IEUBK) model for lead in children for the Flint water situation; requested a subcommittee to identify the exposure assumptions that would be developed for schools and homes
- 10-13-15 CLPPP provided Lead Week Toolkit to DEH
- 10-13-15 Began development of the Lead & Your Body infographic
- 10-13-15 MDHHS Division of Environmental Health, MDEQ, and LARA begin weekly briefing regarding school drinking water sampling
- 10-15-15 Angela Minicuci requests the addition of the MDHHS/GCHD Lead Flint Water Fact Sheet to the Flint Water website
- 10-16-15 First of weekly meetings with city of Flint meeting DEQ HHS LARA GCHD (Jim Henry) at the Mayor's office
- 10-16-15 MDHHS (L. Dykema) participates in meeting with superintendent of Flint schools
- 10-19-15 Supplemental funding legislation passed
- 10-20-15 Daily calls to GCHD changed biweekly (ongoing)
- 10-21-15 Dr. Wells and N. Peeler speak to Medicaid Health Plans (Clinical Advisory Committee meeting) regarding Blood lead testing protocol and case management follow up
- 10-22-15 Angela Minicuci requests updates to the Flint Water website of the Lead Flint Water, and Lead and Your Body documents after GCHD edits; Angela Minicuci contacted Sheryl Thompson about recording a video about how to replace a water filter in collaboration with Home Depot
- 10-23-15 DEQ's videographer, Eric Shaw, met with Home Depot employee in Flint to record his instructions about how to install and replace a filter
- 10-27-15 ETC contracted to provide EBL investigation services
- 10-27-15 Briefing to Director regarding IEUBK modeling for school drinking water screening value.
- 10-27-15 S. Bien received an email from USDA regional representative, Bruce Hillman, indicating that our Congressional Representatives had sent a letter to Tom Vilsack, Secretary of USDA inquiring about community response to address immediate and long-term needs. Regional USDA representative indicated he would be in contact with MDHHS WIC office to receive an update. MDHHS WIC office responded that we continue to work with the local health department to assure that clients are getting access to filters and bottled water to mix their infant formula. WIC also indicated that at that time there had not been any requests from WIC clients for Ready to Feed Formula.
- 10-28-15 DEH requested by Eden Wells to help clarify CLPPP report for the Director
- 10-28-15 – Brita filter replacement video was picked up by Angela Minicuci from Eric Shaw
- 10-30-15 Case management (nursing) contract with Genesee County Health Department begin
- 10-30-15 Angela Minicuci requests that the parent and provider letters, along with their attachments, be posted to the Flint Water website
- 10-30-15 (approx.) 8500 parent information packets distributed to GCHD

## 6 NOVEMBER 2015

---

- 11-3-15 Director's office received a letter from Tim English, Midwest Regional Administrator for USDA
- 11-4-15 Brita filter replacement video posted to the MDHHS YouTube channel
- 11-5-15 Response to Tim English's inquiry drafted and sent to Director Lyon's office. MDHHS indicates continued monitoring of Ready to Feed formula use and coordinating with Ready to Feed manufacturer and WIC retailers to proactively address any supply or distribution issues with infant formula availability.
- 11/6/15 Bruce Hillman, Regional Representation from USDA, notified S. Bien that they had received questions from Katie Bergh from Senator Stabenow's office regarding availability of Ready to Feed, our communication plan, how many clients had requested Ready to Feed.
- 11-6-15 Additional 3500 parent packets distributed to GCHD
- 11-9-15 Transition of 2.0 CLPPP staff to DEH
- 11-12-15 Phone conference with Karla Ruest, Rashmi Travis (MDHHS), Stan Bien (MDHSS-WIC), Kristin Hanulcik (MDHSS- WIC), Bruce Hillman (USDA), Anne Bartholomew (USDA), Katie Bergh (Senator Stabenow's office), and Jaclyn Schneider (Deputy Staff Director US Senate Committee on Agriculture, Nutrition, and Forestry) in regards to the legislative inquiries. Information was provided on how MDHHS is working with the local health department to monitor requests for Ready to Feed formula, continuing to work with the local health department to assure filters and bottled water are provided to clients, and providing educational materials on Ready to Feed formula to WIC clients. To date, only one WIC client had requested Ready to Feed formula.
- 11-13-15 Call with ATSDR, GCHD and MDHS to discuss outreach material
- 11/16/15 Information on Ready to Feed formula (including Talking Points, WIC Provider Letter, and infographic on Ready to Feed formula) was shared with the local health department to share with providers in the community. This same information was provided to Congressional delegates on 11-12-15 phone conference.
- 11-18-15 DHHS Meets with Governor's Flint Water Task Force
- 11-24-15 DEH Project Management Structure implemented
  - Daily Situation Reports-Reps begin being compiled and distributed to MDHHS staff
  - Bi-weekly calls with GCHD change to weekly (ongoing)
- 11-24-15 Information on Ready to Feed formula (including Talking Points, WIC Provider Letter, and infographic on Ready to Feed formula) was shared with Medicaid to share with the Medicaid Health Plans.

## 7 DECEMBER 2015

---

- 12-3-15 MDHHS BLL Summary Report released and is posted to Flint water website
- 12-7-15 Angela Minicuci requests update to the Flint Water website of the Lead and Your Body FAQ
- 12-8-15 Angela Minicuci requests removal of the Fight Lead with a Healthy Diet PDF until it's updated
- 12-11-15 MDHHS BLL Summary Report released and is posted to Flint water website

- 12-14-15 Meeting with MSA to develop specifications for production of Medicaid population based blood lead testing reports for children in Flint exposed to Flint city water source
- 12-23-15 MDHHS issues third summary EBLR report noting change in method, report posted to Flint Water website
- 12-30-15 MSA issues L 15-73 – Blood Lead Guidelines to Address the City of Flint Residents’ Potential Exposure to Lead. This letter was sent to Practitioners, Clinics, Laboratories and Maternal Infant Health Program (MIHP) Providers in the City of Flint.

Subject: FW: 2016-01-04 Flint Drinking Water Action Plan Update - FOIA EXEMPT AND ATTORNEY-CLIENT PRIVILEGED

Please see the attached DEQ updates and note the discussion of the very high level of lead in drinking water at the Whaley Children's Center, which provides day care services. I'll see if George Krisztian has any additional information on our briefing call tomorrow at 8 am and I'll touch base with the group in LARA that has oversight of child care facilities (used to be in MDCH but recently reassigned) to be sure they are aware.

Subject: 2016-01-04 Flint Drinking Water Action Plan Update - FOIA EXEMPT AND ATTORNEY-CLIENT PRIVILEGED

Dear Governor's Office:

Please provide the following to the Governor as a part of his daily briefing packet. If you have any questions, please let us know.

<!--[if !supportLists]--> <!--[endif]-->Flint Drinking Water Action Plan Update  
<!--[if !supportLists]--> <!--[endif]-->Home Owner Results Samples Submitted November-December 2015

As a reminder we will prepare these reports to you weekly, every Monday afternoon, for the previous week's actions.

Also, I have copied Melanie Brown as she has been assigned to the DEQ as the Communications Director until further notice.

Thank you.

Keith Creagh  
Director

## Flint Drinking Water Action Plan Update

### **FOIA EXEMPT AND ATTORNEY-CLIENT PRIVILEGE**

#### **Key Actions:**

On December 28-29, 2015, staff from the DEQ and DLARA conducted the formal plumbing evaluation of Flint Community Schools' Northwestern High School and Southwestern Classical Academy. On December 29-30 staff from DEQ and DLARA then performed the follow-up sampling of the drinking fountains and faucets that are used for consumptive purposes at these two facilities. This completes the initial evaluation process for all 13 schools of the Flint Community Schools. Once the Flint Community Schools has had an opportunity to incorporate the recommendations in the plumbing evaluation reports, a follow-up sampling will be scheduled to ensure that all of the issues have been properly addressed.

Evaluations of the Flint Community Schools will continue to be posted to the Flint water Web site: [www.mi.gov/flintwater](http://www.mi.gov/flintwater). These reports are being shared with Flint Community Schools Superintendent Bilal Tawwab first and then posted. So far, three reports have been posted, with the remaining reports expected to be completed by the end of January 2016.

A list of schools and childcare facilities served by the Flint water system requesting a plumbing evaluation has been created. These facilities will be contacted during the first two weeks in January to schedule a free plumbing evaluation of their facilities. The protocol used will be the same one used for the Flint Community Schools. To date, there are a total of 10 facilities that have requested a plumbing evaluation. Once these 10 facilities have been scheduled, efforts will be made to reach out to additional facilities that may wish to take advantage of this free program.

Video footage was taken on December 29, 2015, of the plumbing evaluation process and the sampling protocol of the drinking fountains and faucets at Flint Community Schools' Northwestern High School and Southwestern Classical Academy. This footage is being used to create a video that provides an easy-to-understand explanation of how the plumbing evaluations and subsequent sampling is being done in the schools. The target audience for this video is primarily the residents of Flint so that they can get a visual of the efforts already underway, but it is anticipated that this video will also be used as an instructional aid for schools elsewhere in Michigan that are interested in having their facilities evaluated.

#### **Positions:**

There are no new positions to report.

#### **Concerns:**

There are no new concerns to report.

## **FOIA EXEMPT AND ATTORNEY-CLIENT PRIVILEGE**

### **Flint Drinking Water Action Plan Update**

Page 2

#### **Significant Event:**

On December 29, 2015, Dan Wyant resigned his position as Director of the DEQ. DNR Director Keith Creagh has been appointed Interim Director of the DEQ. Reports have been created and meetings have been scheduled to provide Director Creagh with a history of the Flint situation as well as current plans for moving forward.

#### **Changes from Previous Report:**

- The Flint water Web site has been redesigned. The old site was beginning to become cluttered and information was becoming difficult to locate. The new design provides a more user friendly interface and has a more elegant flow. It is anticipated that the redesigned Web site will go live during the week of January 4, 2016.
- The DEQ Laboratory identified a lead result as being alarmingly high. This result was conveyed to Flint Action Plan Coordinator George Krisztian so that the customer could be contacted instead of waiting for the final report to go out. Investigation of the address revealed that the sample was taken at the Whaley Children's Center. The facility was contacted, and the contact there was notified that one of the samples that they submitted was in excess of 2,500 parts per billion (ppb), or more than 160 times higher than the federally-mandated action level of 15 ppb. The contact was instructed to take measures to ensure that water from that point was not being used for consumptive purposes. Since the facility provided childcare, Mr. Krisztian described the free plumbing evaluation service available and offered to put Whaley Children's Center on the list of facilities being evaluated. The contact indicated that they would provide the information to management for consideration.
- A review of the results from the free lead testing offered to all Flint residents since November 1, 2015, show a downward trend compared to results from those prior to November 1, 2015. This can be attributed to a number of factors. The switch to using water from Detroit Water and Sewerage Department, the implementation of supplemental phosphate addition, and the colder temperatures are all possible contributing factors in this trend.

Since November 1, 2015, a total of 298 samples have been submitted and analyzed by the DEQ Laboratory. Of these samples, 248 or 83.2% show concentrations of 5 ppb or less. In addition, 279 samples or 93.6% show concentrations at or below the action level of 15 ppb.

While this data is encouraging and indicates that the Flint water supply is moving towards compliance with the Lead and Copper Rule (LCR), it is imperative to view this data cautiously. The LCR specifies what sampling points may be used for compliance purposes. The data for these samples is nonselective and

**FOIA EXEMPT AND ATTORNEY-CLIENT PRIVILEGE**

Flint Drinking Water Action Plan Update

Page 3

potentially may not be coming from distribution points that would be allowed under the LCR. In addition, although the paperwork indicates that samples should not go through a filter, it is possible that some residents are using the free lead testing service to ensure the filters that have been provided do, in fact, remove lead.

**Other Item:**

Attached is a spreadsheet containing data for samples submitted by Flint residents through the free lead testing program.

**Subject:** **FW: Flint Water FAQ Document**

Hi Corinne and Linda,

Geralyn and Elizabeth requested a call with DEQ today in order to brief Nick and respond to some legislative inquiries. Below are my notes from the call that I sent to brief Sue and Mark as well as a Q & A document that DEQ developed and is currently being vetted by the Gov's office. Just wanted to be sure to keep you in the loop on this.

The DEQ PIO (Brad Wurfel) gave a long summary about the Flint water issue. He said bottom line is that the water itself is safe but they have an old water treatment plant and old cast iron pipes that haven't been upgraded in more than 40 years. 15,000 homes have old connections with varying levels of lead. Flint is not in violation of the lead standards however they could optimize the water supply by adding phosphate. Flint is also working on a meaningful optimization plan that will be completed sometime next year. He said that DEQ briefed the Mayor and some legislators on Monday on the situation. **He said Flint's water supply is not an imminent public health problem but a public confidence problem due to the many groups getting involved and controversial reports/media coverage on it.**

Some data from a local group of Peds is showing an uptick in blood lead levels which seems to contradict the data that CLPP collects. I've asked Rashmi to follow-up with Nancy P on a) the issue of the lead testing that a group of pediatricians did in Flint? b) messaging about lead, where it is found in the environment c) a brief explanation in writing that explains the results from the blood lead tests that Nancy's program has access to. I found the charts a bit hard to read/interpret. d) availability of any local programs that might be relevant, and e) anything else that might be useful for us to share with Genesee CHD. I'll also check with Linda D. on this. *(Linda, any thoughts on what might be useful?)*

DEQ developed a Q & A document that is being reviewed by the Gov's office and they will share with us. They will post this on their website after it is approved. DEQ would like the local health department to get involved in the messaging about what can be done such as running the water before using or get

a filtration system. **Mark or I will need to follow-up with H.O. Valacak once we have some suggested talking points and information that can be provided to the public.**

The city owns only the first couple of feet of pipes in connections with homes, the rest is privately owned by the homeowner therefore it would be their expense to replace. The longer water sits in lead pipes, the higher the lead readings. DEQ's testing protocol produces consistent results across the state and matches the EPA's protocol. There are other areas of the state with the same problem. He estimated it would take \$60 M to replace the city's infrastructure. The city has request \$30 M from the state to help with the situation. The state told them to check with Congress. But we are calling on EPA to assist along with our Congressional delegation.

Brad said they are hoping to have their director submit an op ed to the Flint paper (and perhaps have Nick co-sign) with a message such as lead is a serious issue and there are actions that can be taken to minimize exposure. He wants to coordinate our messaging to align. He will circle back with Geralyn on this. Also, they will be reviewing the various water test results and will look at Flint's water treatment protocols. He cautioned that they are receiving FOIA requests every day.

Let me know if you have questions.

Mikelle

**To:** Moran, Susan (DHHS)  
**Subject:** RE: PHA Director briefing

Maternal and child health epidemiology staff analyzed the MDHHS childhood lead poisoning data to assess whether or not the switch to using Flint River water for the city of Flint impacted childhood lead poisoning levels ( $\geq 5$  micrograms per deciliter). An increase was noted after the switch but when controlling for such things as multiple tests, age of children and seasonality in a statistical model the difference was elevated but not statistically significant, that is not beyond chance.

Thanks for providing this detail Jackie. I want to add that our push on the MHP side re: lead case management as a result of the new contract language in the rebid, could (hopefully will) increase the billings for these in-home environmental lead visit numbers (beyond the paltry 50 to date). We are looking at and discussing other options, but wanted to be sure everyone is aware that we are working on some things with your staff Sue (and with Medicaid Policy) to improve this.

**Subject:** RE: Public Comment Review of Proposed Medicaid Policy (Project #1555-LHD)

Hi Sue,

I will try to make a long story short regarding this proposed policy change. There are two types of blood lead home visits. First, there is a nurse assessment visit where the provider goes to the family's home to discuss and teach about blood lead related issues. These visits are not part of this bulletin.

The second, is the in-home lead environmental visit, where current policy allows LHD staff to visit up to two residences for each child with an elevated blood lead level. A second residence may need to be assessed if a child spends equal time at two residences. This is the policy CMS is requiring us to change to only allow for an environment visit in one residence. CMS gave us a sunset date in our state plan to end the second residence visit as of October 2010, and we have been discussing and pushing back on this change since then. They believe that we must limit coverage for environmental investigations to one residence.

CMS wants to finalize this SPA. Just a note – the volume of in-home lead environmental visit is very low. Since FY13, less than 50 visits have been paid and these were primarily for one residence. So most if not all of these would have still been covered under the proposed policy.

As for CMS' concerns from a regulatory perspective they have been citing the following:

42 CFR 440.130(a) is the citation for "diagnostic service" which is how this was defined.

From Chapter 5 (Early and Periodic Screening) of the State Medicaid Manual on CMS' website (Section 5123.2, 1a.):

a. Diagnosis, Treatment, and Follow-Up.--If a child is found to have blood lead levels equal to or greater than 10 ug/dL, providers are to use their professional judgment, with reference to CDC guidelines covering patient management and treatment, including follow up blood tests and initiating investigations to determine the source of lead, where indicated. Determining the source of lead may be reimbursable by Medicaid under certain circumstances. Reimbursement is limited to a health professional's time and activities during an on-site investigation of a child's home (or primary residence). The child must be diagnosed as having an elevated blood lead level. Medicaid reimbursement is not available for any testing of substances (water, paint, etc.) which are sent to a laboratory for analysis.

Let me know if you need anything further.

**Subject:** RE: Public Comment Review of Proposed Medicaid Policy (Project #1555-LHD)

We pulled it back because MDHHS leadership was concerned about heightened anxiety resulting from the Flint crisis and because the potential fiscal impact would be minimal, even if CMS determined that we needed to fund any second investigation with all GF. There just aren't that many cases where a second home needs to be tested. Furthermore, this instance of noncompliance is to the advantage of the beneficiary.

## Blood Testing Protocol Planning Template--- Oct 15 8:00 AM v4

### GCHD and MDHHS

Toni LaRocco, Nancy Peeler, Rashmi Travis

#### I. Prioritization of Testing

- a. Children <6 already tested positive by capillary since April 2014 (n=75)
  - i. Every week GCHD letters go out, educational material is also sent out (nutrition lead sources, etc.)
  - ii. Sending letters at 5ug/dL (new; previously doing at 10 ug/dL)- Letter includes in bold to follow up with PCP
  - iii. 10 ug/dL: making phone call (or sending letter if unable to reach) offering an office visit where clients are given a lead kit which includes: vacuum with hepa filter, mop, simple green and soon will include NSF water filter, gloves and Swiffer. Education regarding use of above, nutrition and medical follow up guidance to return to PCP.
  - iv. 20 ug/dL: two visits with nurse and sanitarian with a referral to MDHHS Lead Safe Homes
- b. Retesting of Flint children with EBLL of venous samples- all due for first or subsequent follow-ups
  - i. No additional letters to this group—[note-no funding avail at this time to chase these folks- Medicaid already covered initial]
- c. School children those in the 3 schools identified as having elevated water lead (Freeman, Brunnell, Eisenhower)
- d. Every school facility- prioritization in this order:
  - i. 0-5 years age
    1. Daycare
    2. Great Start Readiness Pre-school (funded by MDE)
    3. Early Headstart
    4. Headstart
  - ii. 5-12 years of age
    1. Elementary
  - iii. >12 years of age
    1. Middle
    2. High

#### II. Implementation of Testing

##### a. Partners

- i. McLaren Health Plan
  1. McLaren Health Plan is involved with Toni last few weeks. **Nov 5th** is a screening (capillary) event for McLaren clients as well as interested community members. This is a walk-in event-
    - a. Online lead registry (HHLPS) could be accessed to check child's status
    - b. McLaren has access to MCIR but not HHLPS
  2. McLaren will contact their clients, and test their clients

3. GCHD will market to whole community, and GCHD WIC staff will draw other community members-cap or venous as indicated
4. GCHD will look up kids prior to drawing.....if ever drawn and elevated GCHD will do a venous draw instead.
- ii. UM-Flint Nursing students- Toni has been in touch with Nursing school and Licensed (BSN)nursing students may be able to assist Nov 5 and other times possible
- iii. Hurley Pediatrics (Mona)-( n=900)
  1. Mona has all Hurley clinic kids that need a redraw back to April 2014
  2. AND a list of all lead labs drawn from the Hurley Lab back to April 2014
- iv. Children's Healthcare Access Program-(MHEF and United Way)- target Medicaid groups by 4 clinics (Hamilton, Hurley, Dr. Akpinar and Mott)- they can access the majority of the Medicaid children in Flint and have data-sharing agreements already in place. Has social workers staff and 211 and case management, and filter follow-up
  1. Mott Children's Clinic (Reynolds)
  2. Housed at GFHC!
  3. Meeting tomorrow AM (Mona and Toni will be there)
  4. Hamilton FQHC
    - a. CHAP-
    - b. Toni spoke with Susan from CHAP 10/14.....they are paid from a grant through the Health Endowment Fund and we have contracted (not signed yet but will be) to run Medicaid Match through GCHD. Doing things like arranging transportation to get lead levels drawn good role for them as it is reimbursable with Medicaid Outreach.
- v. Molina- Serve largest number of Peds/Medicaid-
- vi. GCMS Pete Levine----network information with all providers to get testing protocol information to them
- vii. Greater Flint Health Coalition-networking information to providers

**Comment [TL1]:** Meeting with PIO and UMFlint Nursing in order to get assistance with Lead testing clinics. 11/5/15 a go. Will be contacting other Medicaid Health Plans to try and have clinic with them at the Farmers Markets

**b. Sites**

- i. Patient centered medical home- whenever possible! Very important. Getting tests done outside of the medical home creates lack of continuity and lack of follow-up. Encourage as much as possible to "go see your doctor".
  1. Which then means that we need to educate the doctors with direct messaging about who to test, when to test, what is follow-up, available resources (211), premade patient education flyers, etc. Focus should be on lead in water education info.
- ii. GCHD- (as above in I.a.)
- iii. McLaren (Nov 5, 2015) at Burton Branch GCHD- all day
- iv. Farmer's Market (GCHD and Hurley Peds) held on (T, TH, Saturdays)
  1. Hurley staff can draw blood at this site
- v. Molina- TBD (see below)
- vi. Other health plans- TBD (see below)

**III. Handling of Results/messaging**

- a. CLPP and GCHD currently have protocol lab test result sharing (HHPSS)
  - i. Bob Scott can assist in navigation
  - ii. MDHHS Bureau of Labs can provide surge capacity for lab testing if needed
- b. All clients drawn will sign a release allowing result to be shared with primary provider
- c. Secondary prevention messaging for all community
  - i. nutrition, good vitamins
  - ii. wrap-around services
  - iii. Breastfeeding, breastfeeding, breastfeeding – breastfeeding is protective for lead in water! Increase number of LC's, support breastfeeding peer programs, etc. Flint has low breastfeeding rate.
  - iv. positive parenting/nurse family partnership, infant support services
  - v. WIC enrollment
  - vi. SNAP double bucks enrollment

**Comment [EVW2]:** a. In the event case management and/or abatement is needed- can all children getting blood drawn have their contact information filled out along with this release?

#### IV. Actions and Assignments

- a. Toni and CHAP will contact Molina to set up similar program as McLaren
- b. Toni will contact all health plans- if issues, contact Wells
- c. MDHHS will provide support as requested for any events
- d. Hilda at GCHD needs to blast provider information about lead to all providers (blast fax and list serves)
- e. FAQ water lead sheet to be sent out today
- f. [Consider- Get HEDIS rates at provider level for lead (doesn't address follow-up, though)]
- g. Next Call: TBD early next week (of 10/19)- Begin planning for Case Management Response
- h. Mona and Toni- if there is a need for increased capillary testing machines---advise MDHHS
- i. Activities/follow up by Nancy/Bob
  - i. work with Communications to support linkage to other early childhood/school state partners at MDE that we already work with that were listed in the plan - Office of Great Start is the link to child care providers (related to subsidy payments and to their subcontract to ECIC to run regional child care resource/TA centers); they are also the state liaison to Head Start/Early Head Start and the Great Start Readiness at-risk preschools. And of course their School Health office.
  - ii. Access to HHPSS data system - currently only GCHD has access - Bob thinks that 2 staff there have been trained to use the system, but we need to confirm when we are back at the office. As I referenced above, we are looking at lead privacy laws to see who else (besides GCHD) might be able to have access to the CLPPP data about follow-up testing.
  - iii. Also, Bob can attend the event on November 5th if you think that would be of help.
  - iv. Regarding CLPPP sending the our list of children needing follow-up to Hurley (when we think there is a Hurley provider), we are also confirming that we can do that based on privacy laws.

- v. We will follow up to make sure that the new CLPPP toolkit materials for providers get out to all of you - our Provider Quick Reference document, and the video Eden referenced is coming soon
- vi. Exploring legal issues around access to the data.

#### Questions from Nancy/Bob –October 14

I b. Medicaid will pay for 2 nursing visits. Toni, I wanted to double check, at what levels is GCHD currently sending out nurses to follow up on elevated blood lead levels (even if only 2 visits) ? And I wasn't sure if I understood on the call - is GCHD billing Medicaid for those visits for children enrolled in Medicaid?

II a iiiii We agree that CHAP could be a good resource that could try to find kids and help get them connected for testing/follow-up testing. Are they paid by health plans/clinics to carry out activities, e.g. that is who their direction comes from (I know that was the model in Kent County)? I ask that related to our thinking about who the CLPPP data (e.g. access to the HHPSS data system) could go to - we have to explore the privacy laws for the lead data (see below).

III a iiiii We concur about using Lead Care machines, but only if there is a better protocol to ensure that children with an elevated capillary test get back for venous testing.

Nick Lyon, Director  
Michigan Department of Health and Human Services  
235 S. Grand Avenue, Suite 1514  
P.O. Box 300037  
Lansing, MI 48993

Dear Mr. Lyon:

I am writing to request your assistance and support in ensuring WIC participants and families in the Flint, Michigan community are aware of the availability of Ready to Feed (RTF) Formula and other supportive services in response to high levels of lead in the water supply.

On October 23, 2015, Senator Stabenow, Senator Peters, and Representative Kildee wrote to USDA Secretary Vilsack to express concern for infants and children participating in the WIC program in Flint where high levels of lead have been detected in the drinking water that is normally used to prepare infant formula provided by the WIC Program. The letter also requested assistance in ensuring that all WIC participants and families are made aware of the availability and option of RTF formula and other services in the Flint community to affected families.

We understand that participants in any of the affected zip codes in Flint are provided an option during the WIC screening and assessment procedures to receive RTF infant formula, and are provided a water filter if needed to mitigate the lead levels in the drinking water. We also understand that WIC participants are referred to the local health department for blood lead testing and are provided nutrition education on mitigating lead absorption through dietary changes. Additionally, caregivers of WIC infant participants have the option to return powder infant formula in their possession to the WIC local clinic and exchange it for RTF.

FNS recommends that the Michigan WIC State agency and the local WIC clinic immediately implement a proactive communication strategy regarding infant formula options to affected WIC participants in the Flint community that may not be scheduled to visit the WIC clinic in the near future. Furthermore, we recommend the Michigan WIC Program implement a broad outreach and educational effort regarding the other supportive services available to WIC participants and families in response to the high levels of lead in the water supply of Flint.

This letter also serves as confirmation of the availability of additional FNS food funds for Michigan, if needed, to cover any potential increased costs for RTF infant formula. FNS is available to provide technical assistance to DHS as your agency responds to this situation. If you have any questions, please let me know, or have your staff contact Bruce Hillman at 312-886-4590.

Sincerely,

A handwritten signature in black ink that reads "Tim English". The script is cursive and fluid, with the first name "Tim" and last name "English" clearly legible.

<FNS Correspondence to State MI WIC RTF 11-3-15.pdf>

*Somewhere can you work in that we led to expect the fact that GCHD was the lead.*

*September 9 Oct*

*July? Shannon*

2. Initial discussions occurred with MDHHS staff and GCHD beginning in the summer of 2014. These verbal discussions continued until the fall of 2014 when staff began to document and elevate the issue in email communications.

MDHHS staff were:

- Tracking the outbreak via electronic disease reports (these often start as Electronic Laboratory Reports and additional case information is provided by the county health department)
- Asked GCHD for the initial line list of cases (first step in an outbreak investigation)
- Reinforced with GCHD staff the need for clinical specimens
- Offered assistance with developing an outbreak specific questionnaire to supplement the routine information obtained on LD cases *(and any other assistance needed)*
- Reaching out to GCHD administration to establish a formal point of contact within GCHD for MDHHS and DEQ to utilize
- Established the need for timely follow-up and response to cases so that all potential exposures could be properly assessed

*The necessity of*  
2.b. Coordination of messaging to providers and the general public regarding the outbreak was discussed with GCHD and offers of assistance were refused. In addition, without an identified source of exposure *(like was able to be determined in the NYC outbreak)* there were no specific warnings for the public or actions that they could take to prevent LD. *community*

*include?*  
2.c. The tracebacks from 2014 and 2015 have been completed. That information is summarized in multiple reports issued by MDHHS. After assessing the status of the investigation in early 2015, MDHHS staff developed a plan to work with GCHD to complete the information retrospectively and for all new cases. The tracebacks in 2014 were completed largely by MDHHS staff and CDC staff working in fellowships at MDHHS. *2014: June 4<sup>th</sup> 2015: Jan 15, 2016 Feb? Jan 27, 2015 conf call with GCHD*

*We did not get this wrong. There were no children among the GCHD cases.*  
3. There are standard definitions used by WHO and CDC to declare an outbreak over. Two incubation periods is an established standard. MDHHS staff began developing that report in April of 2015. At that time 2 cases had been reported in January, No cases were reported in February, one case was reported in March, and no cases were reported in April. While the report was being finalized an additional case was reported in May. Between the March and May cases, the threshold was met for declaring that part of the outbreak over. Again, citing the recent NYC outbreak, additional cases were reported after the outbreak was declared over.

Additionally, "The outbreak is over" is a partial quote that has been used extensively by the media. The entire statement from that sentence and paragraph report follows with:

"As we enter the summer season, MDHHS recommends vigilant legionellosis awareness and surveillance in Genesee County, including interviewing of cases or proxies with the enhanced legionellosis questionnaire within one week of reporting. MDHHS also recommends the clinical community assist in LD surveillance through accurate identification, testing, and reporting of all suspect cases. Obtaining respiratory specimens in addition to urinary antigen testing is of critical importance in these increased surveillance efforts."

The efforts described in this statement are continuing even today, which is how the additional cases were identified and why we ~~are~~ reported it out in the full version of the 2015 report.

3.a. Clinical specimens are collected at the point of care in a healthcare facility by a healthcare provider such as a nurse, physician, or respiratory therapist. MDHHS staff ~~cannot~~ obtain these specimens. They rely on the healthcare community to provide these specimens for testing. Throughout the course of the outbreak MDHHS ~~asked~~ GCHD to work with their provider community to ensure these specimens were obtained. That didn't happen. MDHHS ~~have~~ since worked directly with infection control practitioners to develop guidance specifically for this outbreak on screening patients, collecting specimens, and shipping them to MDHHS BOL so that necessary isolates can be obtained. This activity is ongoing.

4.a. MDHHS staff were working continuously with GCHD and CDC throughout 2015 and still today. Epidemiologic data was collected in a standardized way and has been reviewed by all agencies. In Legionnaire's disease outbreaks we look for common community exposures that can be assessed and investigated. The only common exposure that has been identified is McLaren Hospital in Flint.

5. MDHHS continues to work with GCHD and CDC:

- These staff have developed a toolkit called Developing a Water Management Program to Reduce Legionella Growth & Spread in Buildings. MDHHS and GCHD will be the first state and local agencies to distribute and implement these tools.
- MDHHS recently updated and distributed Legionellosis Guidance for Clinicians which covers testing, clinical specimen collection and shipping, diagnosing, and treating Legionnaire's disease. This was sent to the three hospitals in Genesee County and to all providers in Genesee County who are subscribed to our Health Alert Network.
- We have reviewed GCHD and provided feedback on the GCHD surveillance plan for 2016.

The Governor has provided funding to Wayne State University to...

6. Hundreds of cases of Legionnaire's disease are reported in Michigan every year. Most of these cases are sporadic, and not able to be linked together as clusters and outbreaks. Nationally, Legionnaire's disease has been on the rise since 2003. The last cluster identified in Michigan occurred during the summer of 2013.

13. On 1/28/2015 Shannon Johnson (Legionnaire's disease SME) sent the following email to her unit manager, section manager, and division director:

"I just spoke with Corinne, Nick Lyon has requested some information on the Genesee situation. I gave her the epi curves, the cumulative case count graph for Genesee and the surrounding counties, and forwarded her the email we sent Genesee yesterday afternoon. I also gave her a brief synopsis of the conference call from yesterday. I told her if she needed any additional information to let me know. Think she has already spoken with some of you, but just wanted to make sure we're all on the same page."

21. Michigan is a home rule state. The health officer at GCHD has primary authority in Genesee County. MDHHS are available to assist GCHD staff upon invitation. In the case of the rise in reported cases of LD,

.....

MDHHS staff reached out repeatedly to all levels of GCHD from the beginning of this outbreak to try to assist their investigation. MDHHS staff routinely seek input from experts at CDC, and especially during outbreaks. Authority is local, then state, then federal.

GCHD has primary responsibility to inform the public for all events of public health significance occurring in their jurisdiction.

MDHHS has established an internal reporting mechanism for ongoing outbreaks to be shared with the Population Health and Community Services Administration. <sup>monthly</sup>

22. Routine communications regarding reportable conditions and outbreaks occur between CDC and MDHHS staff.

MDHHS staff were most concerned with ensuring consistent, reliable, and efficient communications <sup>among</sup> between the three agencies. This was requested by CDC and MDHHS on multiple occasions.

GCHD, MDHHS, and CDC jointly participated on conference calls discussing the investigation during the course of the outbreak. <sup>several</sup>

23.a. MDHHS staff did not prevent GCHD from communicating with the CDC.

The email you reference was preceded by an email on 6/6/2015 from Laurel Garrison of CDC stating:

"Jim, I think it would be best for you to reach out to CDC if needed once you have talked this out with the county. Perhaps you should have a talk with them about sharing information with the state first, and then if needed you will pull us in. Laurel"

CDC and the state were trying to ensure that consistent, reliable, and efficient communication between the three agencies involved.

24. CDC, MDHHS, and GCHD staff were all discussing the outbreak at that time. MDHHS staff were aware and involved. CDC was reiterating the concerns of MDHHS at that time and was encouraging GCHD to act quickly. Many of the recommendations made by Laurel Garrison in that email were already being undertaken by staff at MDHHS to facilitate the investigation.

25. At no point did MDHHS staff try to sabotage this investigation. MDHHS was continually working with GCHD to conduct a comprehensive investigation and to try to determine the source of the outbreak. From the beginning of this outbreak the two suspected sources were the Flint water system and a single healthcare facility in Flint. <sup>GC was not even aware of how many deaths there were until we became involved in the investigation.</sup>

<sup>25 a</sup> 26. MDHHS maintained surveillance for LD in 2015 and continued to work with CDC and GCHD. The initial offer to GCHD to assist them with conducting outreach to the healthcare provider community and to the general public was made 01/27/2015. <sup>formal written</sup>

Suzanne: So you think this is an OB? Jan. 2015

**4/30/15 – MDHHS call with GCHD & CDC (see agenda) EIS Officer and CDC/CSTE Waterborne disease fellow present findings of analysis of interview data. MDHHS then has a separate call with DEQ.**

**Call Agenda**

**Summarizing the Investigation/Epidemiology**

- Preliminary Statistics MDHHS (Shannon & Susan)

- Interview Data MDHHS (Lily & Meghan)
  - o EPI Info Analysis

- EPI Curve GCHD

- Discussion of Current Investigation All

**Environmental Investigation**

- Environmental Sampling Protocol CDC

- Discussion All

**Additional Recommendations**

- Additional Recommendations CDC/All

5/1/15 – GCHD sends CDC (cc's MDHHS) an update on confirmed case counts. CDC replies to GCHD (cc's MDHHS) offering some information about investigating water-related health effects in general (not specific to legionella) and suggests they may be applicable to this investigation.

5/7/15 – 5/13/15 – EIS officer and 2 CDC/CSTE fellows analyze questionnaire data for MDHHS

5/8/15 - CDC/CSTE waterborne disease fellow wrote in her monthly report to the Waterborne Disease Branch that "Investigating Legionnaires' Disease outbreak localized to a single county. Interviewing cases and entering data into EpiInfo. Analyzing interview data."

5/13/15 – 5/27/15 – EIS officer and both CDC/CSTE fellows work together on legionella analysis and report writing for MDHHS, exchanging multiple emails about the analysis. They discuss whether there have been one or two cases who spent their entire incubation period hospitalized.

5/15/15 – CDC legionella group sends MDHHS email asking if they've been able to find anything yet with the epi analysis. MDHHS replies to CDC and GCHD with an update noting "nothing remarkable stands out (other than the initial hospital cluster)."

5/18/15 – MDHHS provided updated clinical guidance to GCHD for HAN; drafted letter to be mailed out to cases not yet interviewed (unable to contact) as a last call.

5/22/15 – EIS officer sends preliminary summary of questionnaire data for the first 45 cases to MDHHS CD colleagues for review

5/28/15 – EIS Officer provides updated results of legionella data analysis to MDHHS CD Division colleagues. MDHHS legionella epidemiologist replies to EIS Officer and both CDC/CSTE fellows "Thanks for all your hard work on the analysis! It turned out really, really well. You did an excellent job!"

March 2015) to complete epi data. Obtained death certificates for deceased cases. Updated MDSS case records. MDHHS mapped cases on Flint water system map

3/5/15 – EIS officer wrote in her February monthly report: "Assisted in the development of a Legionellosis exposure and travel history interview tool to be used to investigate a current outbreak in Michigan (3 hours)."

3/6/15 - CDC/CSTE waterborne disease fellow wrote in her monthly report to the Waterborne Disease Branch that "Investigating Legionnaires' Disease outbreak localized to a single county. Developed supplemental questionnaire, Epiinfo form, and database, and interviewed cases."

3/26/15 – CDC/CSTE waterborne disease fellow gives update on interviews to MDHHS staff, noting that they had been able to contact 32 of the 44 cases (MDHHS had interviewed 10 and GCHD 4 to date).

4/9/15 - CDC/CSTE waterborne disease fellow wrote in her monthly report to the Waterborne Disease Branch that "Investigating Legionnaires' Disease outbreak localized to a single county. Interviewing cases and entering data into Epi Info for analysis. No clear associations identified yet."

4/22/15 – MDHHS call with CDC and GCHD. GCHD follows up by email to CDC saying "We appreciate your comments about a measured response. We recognize we don't have the data we need for further action."

4/23/15 – CDC legionella group responds to GCHD, "If you are interested in discussing the Legionella action items in more detail, please let me know your availability for a conference call involving county, state, and RDB." CDC/CSTE Waterborne disease fellow offers to MDHHS colleagues to begin preliminary analysis of interview data received to date.

4/27/15 – GCHD replies "Our team is available Friday, May 8<sup>th</sup>...if that would work for you and our state colleagues."

CDC legionella group emails GCHD stating that CDC leadership is very concerned about the Genesee County legionella outbreak and says it deserves a comprehensive investigation and that CDC feels a sense of urgency. She describes assistance that they can provide from Atlanta as well as offering assistance through an Epi-Aid.

GCHD replies that they are trying to coordinate schedules for 4/30 or 5/1. CDC legionella group replies, "yes, let's try to schedule something for this week." They agree to have a call on 4/30 with CDC, GCHD, and MDHHS.

4/28/15 – CDC/CSTE waterborne disease fellow prepares analysis and brief summary for call with CDC. CDC legionella group sends document on CDC Sampling Procedure and Potential Sampling Sites to GCHD.

4/29/15 – MDHHS EIS officer and CDC/CSTE fellows finalize epi analysis from survey results. DEQ meets with McLaren & Hurley to review HACCP programs re plumbing systems

**Subject:** RE: Genesee County Water Issues Meeting 1/4/15 11am  
**Attachments:** Final Genesee supplemental questionnaire.pdf; Flint Water System Issues Discussion Agenda.docx

Attached is an agenda for our meeting on Monday morning at 11am along with the call in information. There are several objectives for this meeting:

- Organize a review of the Flint water system in order to assess health risk (Legionella, other water illnesses, contaminants, other health issues)
- Share information regarding the current Legionella epidemiologic data review process which includes feedback on the current Legionella questionnaire
- Identify ASHRAE 188 Education/Outreach resources
- Discuss lessons learned in other communities that may assist our situation (Lead, etc.)
- Review risk assessment communication resources
- Discuss the creation of a Health Assessment Advisory Team

Just a quick review of what has happened since our conference call:

- GC has one new reported Legionella case (reported yesterday)
- We have discussed data needed for a water system review
- Epidemiologic data is being analyzed related to Legionella cases from May 2015 to present
- Marc Edwards has shared Legionella test data from 2 hospital systems using Flint water. Legionella was present in both. This reinforces our concerns and the need for ASHRAE 188 education/outreach. He will test additional buildings in the new year.

We hope the creation of a Health Assessment Advisory Team will allow us to identify potential risks in advance and to create appropriate messaging. We expect that this call will allow us to clearly identify next steps and which parties are best suited to assist in addressing those concerns. GCHD staff will meet in the EOC.

We greatly appreciate your participation in the call.

Sure! I will be happy to take a look! Stay tuned...

I am looping back in the other folks from our team, as well as Jay. I think they fell off the exchange when I had to resend that initial email to you, Suzanne. My apologies!

Suzanne, you mentioned that Monday we will be talking about next steps. Somewhere earlier in that email exchange there was something about the 2 hospitals that Marc Edwards tested. Were they positive for Legionella? Just to catch us up to speed, could either of you give us a quick rundown of:

- What's happened in the interim since our call December 10?
- What are the *Legionella*-specific activities taking place currently?
- What kind of next steps are you hoping to define? Epi investigation? Environmental investigation? Remediation?

I hope I am not making things more complicated. We just want the conversation to be as productive as possible... the more we understand about the current situation and needs beforehand, the better prepared we can be.

Again, thank you!

Laura Cooley,

My name is Christine Rygiel and I am the Epidemiologist for the Genesee County Health Department. I am currently working with the Michigan Department of Health and Human Services (MDHHS) with a summary analysis with all the information collected from our questionnaire (attached), as well as information we gathered from the hospital records. Please have a look at our questionnaire. We would appreciate feedback on anything that may improve the interview process. Also, I would be more than happy to share the data analysis once we have finished it! But with the recent holidays it may be a few weeks. Once we finish analyzing this data, we hope to have a better understanding of what might be ruled in or ruled out as a possible explanation for the increase in Legionella over the past couple years.

In addition, we had another confirmed case this morning. We are still gathering information on this individual.

Let me know if you have any questions!

Hi Jim and Jay,

See below and attached. Are you in the loop on this? I have concerns about this last paragraph:

"We remain vigilant with our surveillance efforts and are reaching out to the Environmental Protection Agency for their expertise in reviewing our data. A formal report has been submitted to the Centers for Disease Control through our MDHHS colleagues. GCHD continues to seek out Legionella expertise to address this observed increase in disease."

As you're aware, we haven't received a formal report from MDHHS, and haven't received a request to review anything in any formal or informal way since June. When we offered to arrange a call recently, the offer was declined. Of course we are ready to assist if there is a need, but I'm concerned that this statement is misrepresenting CDC's current involvement.

If the county is open to incorporating additional feedback, our communications specialist took a look at this and provided some edits (attached). She has a lot of experience with messaging around Legionnaires' disease outbreaks. Let me know if I should share this with the county directly.

Thanks,  
Laurel

Bob (and task force),

I have been trying to get to the bottom of reports of increases in reported cases of Legionnaires Disease in Genessee County and finally reached the correct people. They shared some data that is very concerning and although they can't pinpoint the exact source of Legionella, drinking water can't be ruled out. Large increases in cases (my understanding is there were associated deaths) started shortly after the change in source water and all of the DS problems. They County needs to put out a press release regarding their findings and are obviously very concerned with how the public will react given all that has happened in Flint. They asked me to look at a draft of the release and I suggested I take it to the Task Force (they obviously agreed). The attached draft is short and I think they need a very quick turnaround (I will ask). Is it safe to say we can provide a quick review?

On a different topic, were there any plans/discussion of the task force meeting in Flint next week? Mike and I had planned a trip up there because Flint's technical advisory group was supposed to meet. That meeting has been cancelled but we felt the need to still travel up there to meet with various groups. The Genessee County group would like to meet on Tuesday afternoon next week to go over their study.

**Subject:** RE: Follow-up Information

Hi Suzanne & Jim,

Thanks for forwarding your response plans for future Legionella cases. Although we didn't discuss this, in addition to the steps below, now that the weather is warming up, sending out a low-level HAN to all Genesee providers would be a good way to make sure providers are on alert to consider legionellosis and to include for them the MDHHS Legionellosis Guidance for Clinicians. Providers need to be aware that a culture specimen should be collected at the same time as the urine (for the urine antigen test) and prior to the initiation of antibiotics, if at all possible. It's likely too late once we have a positive urine antigen to then go back and try to obtain a culture specimen. We can update the guidance document to include some additional detail about specimen collection and testing to reflect that:

-If a provider orders a urine antigen test on a patient with suspect Legionellosis, a respiratory culture for legionella should be collected at the same time.

-A bronchoalveolar lavage or tracheal aspirate are the preferred specimens collection methods. If those are not able to be done, a sputum specimen may be used, but the likelihood of recovering the bacteria may be decreased.

-The urine antigen and respiratory cultures should be tested by the hospital laboratory. In the event that a hospital lab is unable to perform a urine antigen or respiratory cultures, specimens may be sent to the state health department laboratory.

-Any clinical specimen remaining from the culture should be frozen and stored immediately [this would stay frozen if being sent to CDC].

-If a Legionella isolate grows, a slant or plate should shipped to the state health department laboratory overnight on cold packs. A courier is recommended for plates as they do not travel well.

(If an isolate does not grow, we will need to work with BoL to determine whether the frozen clinical specimen should be shipped to the state lab for testing, or to CDC)

Shannon contacted our lab regarding what the CDC mentioned yesterday about freezing the specimens. For the shipment of isolate slants or plates to BoL, they only need to be sent on cold packs. We believe CDC was talking about the shipment of clinical specimens, which we generally shouldn't need to do because hospital labs are capable of performing respiratory cultures. If it will help, Shannon is willing to create a flowchart to show the steps of clinical specimen collection and testing.

Here's a few comments/suggestions for your response plan in red below. Wishing you both a Legionella-free weekend!

-S

To: Bohm, Susan (DCH)  
Cc: Henry, James  
Subject: RE: Follow-up Information

Susan

Based on our conversation with you yesterday, I am forwarding our plan for any future Legionella weather months approach.

*Talking w/ hospitals  
about specimen collection*

Once we have a Legionella case identified:

- Enter the case in MDSS within 24 h of notification if not already entered by provider
- Email Regional Epidemiologist with MDSS number
- Call hospital to verify that a respiratory specimen was collected for culture within 24 h of notification
- If Legionella isolate was found, verify that the hospital will send to BOL (see above for more details on this)
- Using the enhanced Legionella Disease Questionnaire, conduct interview as quickly as possible with case or proxy and upload to MDSS record when completed (We would like to review the current Legionella questionnaire with input from our state and CDC colleagues as we examine the current questionnaire data from the investigation so far...so we can make appropriate adjustments – good idea)
- Based on information collected from interview, evaluate with investigation team if environmental samples from the home should be collected. We think we have a solution for the environmental sampling. Our on-site CDC EIS Officer may be willing to assist Jim Henry with the sampling. Logistically it would be difficult for a CDC Epi-Aid team to come in and sample if these cases continue to trickle in.
- Continued analysis of existing data
- Continue conversations with our state and CDC colleagues and other experts that may assist the investigation(s).

As we shared in our conversation yesterday, Shurooq is reviewing the previous 5 years Legionella cases to examine the number of cases that live in the City of Flint vs. other areas. We will also be reviewing syndromic surveillance data for the same time frame for respiratory, skin rash and gastrointestinal illness.

Our concerns moving forward are:

- Collection of clinical samples- based on the comments from the CDC about collection of samples being an art as well as a science, we want to make sure we collect appropriate samples. The CDC has already provided a change to the protocol with the request for frozen samples. [see above]
- Collection of environmental samples- GCHD staff members have not had experience collecting these types of environmental samples – see above.
- Access to information. We have shared our concerns regarding obtaining information to assist our investigation

As always, do not hesitate connecting with us if you need additional information. We want to ensure clear and continual communication as we move forward.

Thank you.

Suzanne

## Fiedler, Jay (DCH)

**From:** Busch, Stephen (DEQ)  
**Sent:** Friday, April 24, 2015 2:40 PM  
**To:** Fiedler, Jay (DCH)  
**Cc:** Johnson, Shannon (DCH)  
**Subject:** Flint Hospital Meetings

Jay,

Just wanted to let you know that my engineer, Mike Prysby, and I have scheduled meetings with the McLaren and Hurley hospitals' facility operations management next Wednesday 4/29 to go over any HACCP programs they may have in place regarding their premise plumbing systems.

We plan to cover all aspects including,

- Team members
- Process flow
- Onsite audits
- Hazard analysis
- Risk characterization
- Critical Control Points
- Monitoring
- Verification
- Documentation/Recordkeeping

I will follow up after the meetings with any notable findings.

Stephen Busch, P.E.  
Lansing and Jackson District Supervisor  
Office of Drinking Water and Municipal Assistance  
MDEQ  
517-643-2314

Water Maps  
Water Age  
Water Main Breaks

Hurley - No plan, No treatment,  
No monitoring

McLaren - Monitoring: Sep, Oct, Jan, Feb, Mar, Apr  
- Continuous treatment system  
- O&M meeting to talk  
- Every six months hypochlorination  
- Testing for hypochlorite, monitoring Cl residual.  
- Will work w/ them on control plan

Both Facilities. Have trouble w/ temporary

Mc - S/O H/c today. Focusing on H/c.  
M/A More consistent monitoring.

**MDHHS issues update to 2015 Legionnaires' disease report for Genesee County**

LANSING, Mich. — As part of the ongoing investigation into the increase of Legionnaires' disease (LD) in Genesee County, the Michigan Department of Health and Human Services (MDHHS) today issued an updated report for 2015. The report identifies additional cases and deaths identified since the last report, and provides further analysis regarding the investigation: *(2 of which were deaths)*

"To date, 91 cases and 12 deaths have been identified in total for the 2014 and 2015 healthcare-associated outbreaks in Genesee County," said Eden Wells, M.D., Chief Medical Executive with the MDHHS. "We remain vigilant in identifying any potential case associated with the outbreak, and will continue to update information as it becomes available."

Of the additional cases, two had not been appropriately referred to the public health system. The electronic messages generated by the hospital laboratory system were flawed and the healthcare providers failed to report the cases. The third case was reported in a different jurisdiction and there was no epidemiologic information available to link it to the outbreak. All of the new cases were identified by MDHHS personnel during a review of hospital testing data that was forwarded to the department in the past week.

Of the 91 total confirmed cases between June 2014 and November 2015, 31 people, or 34 percent, received city of Flint water to their residence. A total of 26 people, or 29 percent, had no known exposure to a Flint hospital in the two weeks prior to illness, nor were their homes on the Flint water system. Other possible exposures were evaluated and no known community or residential exposures have been identified.

For the May 2015 to October 2015 time period, 46 LD cases and seven deaths have been confirmed in the Genesee County outbreak. Data previously indicated 43 cases and five Legionnaires-associated deaths for 2015. The number of cases for June 2014 through March 2015 time period has remained unchanged with 45 LD cases confirmed, including five associated fatalities.

Legionella is a type of bacteria commonly found in the environment that grows best in warm water, such as hot tubs, cooling towers, potable water systems, and decorative fountains. When people are exposed to the bacteria, it can cause legionellosis, a respiratory disease that can infect the lungs and cause pneumonia. The bacteria can also cause a less serious infection called Pontiac fever. Legionella is not transmitted person to person.

MDHHS has partnered with Wayne State University and continues to work with the Genesee County Health Department (GCHD) and the Centers for Disease Control and Prevention (CDC) on enhanced surveillance which will continue in 2016.

###

# October Flint Field Sampling Results

# August Sampling Results

	<i>Acanthamoeba polyphaga</i> <i>Vermamoeba vermiformis</i> <i>Pseudomonas aeruginosa</i> <i>Mycobacterium</i> spp. <i>Mycobacterium avium</i> <i>Legionella</i> spp.								
Flint Businesses Positive* (n=9)	Water	0	2	0	4	0	2	0	
	Biofilm	1	2	0	5	0	1	0	
Flint Homes Positive* (n=7)	Water	0	4	0	5	0	5	0	
	Biofilm	2	2	0	3	0	1	0	
Detroit Water Businesses Positive* (n=4)	Water	0	0	0	2	0	0	0	
	Biofilm	0	2	1	3	0	0	0	

- *Legionella* spp. in 47% Flint water sites
- High concentrations of 2500 gene copies/mL
- No *L. pneumophila* detected

# Legionellosis Public Health Data

- 46 cases reported by 3<sup>rd</sup> week in November in Genesee
- On pace for 12.5 cases per 100k citizens
- Almost 10 times the national average of 1.3/100k
- African Americans have 50% higher incidence than whites
- Multiple concurrent LD cases in Flint hospitals
- Sources not traceable: no outbreak confirmed
- OPPs were predicted to be a potential public health issue with the switch to Detroit water

# Sampling Regime

- 62 one liter water samples from public sinks
- Cold first draw followed by hot post-flush
- Sampled afternoon of 10/15 and morning of 10/16
- Tested for wide range of metals on cold samples
- Measured flow, temperature, and chlorine on site
- Performed DNA based analysis for *Legionella* spp. and *L. pneumophila*

# Physical Data

- No elevated levels of metals were detected
- 70% hot water temperature in ideal growth range
- 87% cold water temperature at/near growth range
- 60% taps under ideal chlorine residual
- 0% taps reached scalding temperatures

# Hurley East

# Hurley West

# Hurley East

# Hurley West

# Microbial data

	<i>Legionella</i>	<i>L. pneumophila</i>
Hot % (n=29)	97	93
Hot Max Concentration	66018	5408
Cold % (n=30)	77	60
Cold Max Concentration	119028	4237
Combined % (n=59)	86	76
Combined Mean Concentration	14123	1969

- Concentrations in gene copies/ml
- Samples have yet to be re-tested for assay inhibition
- Number of positives may increase with additional analysis

# Summary

- High frequency and concentration of both *Legionella* and *L. pneumophila* measured

# City of Flint, MI Water Quality Report

Technical Advisory Committee

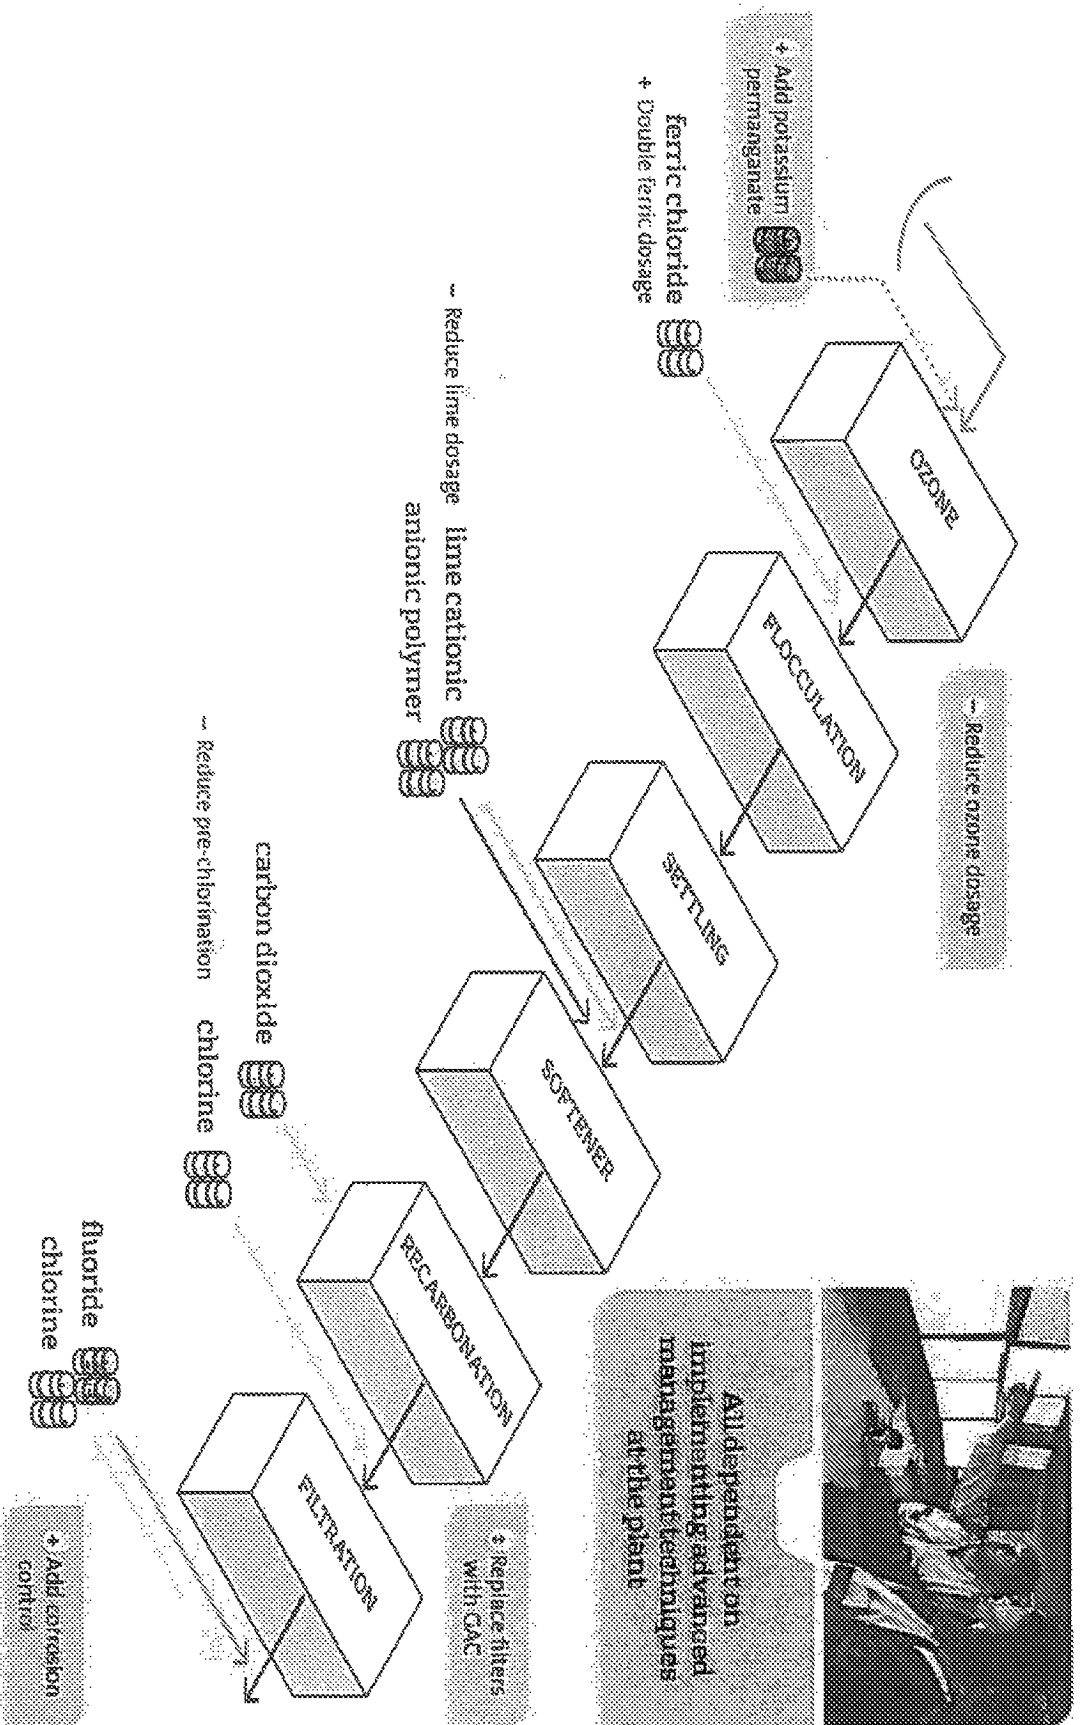

# Solution Involves Coordination of 3 Activities

- **Water plant improvements**
  - Optimize chemical dosages
  - Consider different chemicals
  - Install granulated activated carbon
  - Complete plant upgrades
  - Implement best mgt practices
- **Distribution system improvements**
  - Fix broken valves
  - Ask for customer feedback
  - Reduce tank storage
  - Target line flushing
  - Run a hydraulic model
- **Better communication with customers**
  - Engage advisory committees
  - More accessible utility
  - Make it easy to access information
  - Better customer communication

# Optimize Plant Processes

# TOC Removal Efficiency Optimizing Current Plant

## Potassium Permanganate Dosing Graph

Mathematics 2022, 10, 1008

55

[illegible]

# Bromate Dosing Graph

# Dosage of Ferric Chloride

# Lime Dosage Graph

## Implement Best Management Practices

### Activities to Help Operators Maintain Good Water Quality

- Process Control Management Plan
- Lab QA/QC Program
- Computerized Maintenance Management System
- Asset Management System
- Training and Certification Program
- Vulnerability Plan

# Water Age Map

- Speed up flow of water from plant to homes – 2 weeks plant to house
- Find closed valves & open them
- Replace broken valves
- Update hydraulic model
- Reduce system storage
- Track customer complaints
- Test customer water
- Spot flush hydrants to clean areas of stagnant water in the system

March 4, 2018, Technical Advisory Committee

Conceptual Map

Troublesome TTHM Test Sites

## **Make It Easy to Access Information and People**

### **Develop a proactive customer communication plan**

- Create advisory committees to help direct efforts and improve flow of information
- Add additional communication personnel for the utility
- Develop a pro active communication program
- Establish a single point of contact to manage all water quality complaints
- Provide additional customer service training and tools to staff
- Expand neighborhood and community outreach
- Change monthly billing statements from card to envelope with information

Questions?

at	The concentration of a contaminant, which, if exceeded, triggers treatment or other requirements which a water system must follow.
ctis	HAA5 is the total of bromoacetic, chloroacetic, dibromoacetic, dichloroacetic, and trichloroacetic acids. Compliance is based on the total.
Annual Average	
Plant Level	The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
at Level Goal	The level of contaminant in drinking water below which there is no known or expected risk to health.
Disinfectant Level	The highest level of disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
Disinfectant Level Goal	The level of a drinking water disinfectant below which there is no known or expected risk to health. MRLDG's do not reflect the benefits of the use of disinfectants to control microbial contaminants.
disinfectant	
idity Units	Measures the cloudiness of water.
Micrograms (billion)	The ppb is equivalent to micrograms per liter. A microgram = 1/1000 milligram.
Micrograms (million)	The ppm is equivalent to milligrams per liter. A milligram = 1/1000 gram.
Micrograms	
Micrograms	A required process intended to reduce the level of a contaminant in drinking water.
Micrograms	Total Trihalomethanes is the sum of chloroform, bromodichloromethane, dibromochloromethane and bromoform. Compliance is based on total.

## City of Flint 2014 Annual Water Quality Report

The Consumers Annual Water Quality Report provides important information about your drinking water. This report includes information about the source of the water, health information, charts that summarize regulatory required testing results, and a table giving explanations of important terms to understand when viewing the test results. The City of Flint Department of Utilities is dedicated to providing quality drinking water to the residents of the community. The Flint Water Plant operates and maintains a certified drinking water laboratory to assure compliance with all state and federal regulations, and is committed to prompt and thorough notification to the consumers if there is any reason for concern about the quality of the drinking water. Information about your drinking water is available on the City of Flint web page at [www.cityofflint.com](http://www.cityofflint.com) or by calling the City of Flint Water Plant at (810) 787-6537. The Safe Drinking Water Hotline at (800) 426-4791 is a resource for health related questions and water quality issues. General drinking water information can also be found on the U.S. Environmental Protection Agency (EPA) web site at [www.epa.gov/safewater/](http://www.epa.gov/safewater/).

## Water Source

The City of Flint began using the Flint River as a water source in May of 2014. Flint is located roughly in the middle of the Flint River Watershed. The Flint River watershed includes Holloway Reservoir, C.S. Mott Lake, Kearsley Lake, and numerous streams and creeks that drain to these lakes or directly into the Flint River. The Michigan Department of Environmental Quality in partnership with the U.S. Geological Survey, and the City of Flint Utilities Department conducted a source water assessment in February 2004 to determine the susceptibility of potential contamination. The susceptibility rating is a seven-tiered scale ranging from "very low" to "very high" based primarily on geologic sensitivity, water chemistry, and contaminant sources. The Flint River source water intake is categorized as having a very high susceptibility to potential contaminant sources. If you would like to know more information or a complete copy of the report, contact the City of Flint Water Plant at (810)787-6537.

The use of the Flint River as a source water for the City of Flint Water Treatment Plant was a temporary move, driven largely by economics and the financial state of the City. The City of Flint joined the Karegnondi Water Authority (KWA) in 2010. The KWA consists of a group of local communities that decided to support and fund construction of a raw water pipeline to Lake Huron. The KWA will provide the City of Flint Water Treatment Plant with source water from Lake Huron. The KWA pipeline is currently under construction, and is scheduled to be completed by the end of 2016.

KWA pipeline construction

## General Information

In order to ensure that tap water is safe to drink, the EPA prescribes regulations, which limit the amount of certain contaminants in water provided by the public water systems. The Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water, which must provide the same protection for public health. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (800-426-4791).

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- ♦ Microbial contaminants; such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- ♦ Inorganic contaminants; such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- ♦ Pesticides and herbicides; which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- ♦ Organic chemical contaminants; including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- ♦ Radioactive contaminants; which can be naturally-occurring or be the result of oil and gas production and mining activities.

## General Information (cont.)

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Infants and young children are typically more vulnerable to lead in drinking water than the general population. It is possible that the lead levels at your home may be higher than at other homes in the community as a result of materials used in your home's plumbing. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Flint Department of Utilities is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. If you are concerned about elevated lead levels in your home's water, you can minimize your potential exposure to lead in your water by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

## Current Drinking Water Issues

The City of Flint experienced drinking water issues in the summer of 2014. Issues began with areas of the city experiencing "rusty" water. This was largely due to the city distribution system, which contains hundreds of miles of cast iron pipe. As these pipes age and degrade, iron is released, causing the water to exhibit color. Other contributors to this issue include water main breaks and repairs, routine distribution system maintenance, and a source water change which exposed the pipes to a slightly different water chemistry.

The City of Flint received violations from the Michigan Department of Environmental Quality (MDEQ). A violations for total coliforms and *E. coli* in September, and a corresponding total trihalomethane (TTHM) violation in December. As routine sample site testing in the city distribution system began to detect bacteria, system flushing increased, and chlorine addition at the water treatment plant also increased. The resulting increased chlorine addition then resulted in the higher formation of THM's through the warm weather months.

While facing these issues, the City of Flint took steps to confer with industry professionals and state regulators in regards to treatment plant operation and distribution system operation. In the fall, as water temperatures dropped, and improvements were completed in the distribution system, THM levels were below the maximum contaminant level during routine November monitoring at 7 of the 8 monitoring sites.

## Moving Forward

The City of Flint has taken many steps to help correct the underlying issues that resulted in drinking water violations. Water treatment plant and distribution system corrective actions that were taken or are currently in progress include:

- Limiting the use of storage reservoirs during the warm weather months.  
Warm water temperatures and water age are large contributors to the formation of THM's.
- Optimizing ozone pretreatment by updating control programming along with cleaning and inspection of the ozone generators. Ozone is a powerful oxidant that provides a level of disinfection along with taste and odor control.

### Moving Forward (cont.)

- Currently finalizing the installation of granular activated carbon (GAC) to the filtration process, which should be complete by the end of July 2015. GAC will reduce THM's by removing the chemical precursors that react with chlorine to form the THM's.
- Increased water main flushing frequency in an effort to alleviate stagnant water, and reduce water age in the distribution system.
- Update of distribution system water hydraulic model, to determine possible problem areas.
- Repaired and replaced several large water main valves, which were inhibiting the designed flow of water through the system.
- Currently finalizing plans for the replacement of a large section of a 24" transmission water main in an area of concern in the distribution system. This project should be complete by the end of 2015.
- Currently completing a distribution system evaluation of 7000 water main valves that control the flow of water throughout the city. This project will be complete in July of 2015 and will provide information to guide decisions with further repairs and future projects.
- Currently working on several upgrades at the water treatment plant in preparation for KWA.

The City of Flint is dedicated to resolving the issues that are facing the water system, and will continue to make positive steps forward as we prepare for the future. The City would like to thank all the residents and customers for their patience and understanding as we face the challenges ahead. The trials and tribulations that we have faced with the switch to the Flint River as a source water will prove to be important as we move ahead as a member of the KWA. Many of the distribution system issues experienced while using the Flint River may have been experienced with any change in source water. As we continue to address the issues, take steps to be proactive, and the transition to the KWA pipeline, we can assure a future of quality drinking water in the City of Flint.

The following pages of this report include the results of 2014 regulatory testing. If you have any questions about this report or other water related concerns please contact the City of Flint Water Plant at (810) 787-6537.

## 2014 Regulated Detected Contaminants

### Monitored at Treatment Plant

Inorganic & Organic Chemicals, Metals, and Pesticides						
Regulated Contaminant	Unit of Measure	MDCL	MCL	Highest Level Detected	Range of Detection	Violation
Inorganic Chemicals						
Fluoride	mg/L	4	4	0.88	0.12 ~ 0.88	No
Nitrate	mg/L	10	10	0.5	ND ~ 0.5	No
Metals						
Barium	mg/L	2	2	0.03	0.02 ~ 0.03	No
Selenium	mg/L	0.05	0.05	0.001	ND ~ 0.001	No
Pesticides						
Atrazine	mg/L	0.03	0.03	0.0003	ND ~ 0.0003	No
Organics						
Total Xylenes	mg/L	10	10	0.0005	ND ~ 0.0005	No

More than 100 other chemicals were monitored quarterly throughout the year that were not detected. The various classification groups of these chemicals include metals, carbamates, herbicides, pesticides, organics, and radiologicals.

Total Organic Carbon, TOC			
Regulated Contaminant	Required Monthly % Removal	Minimum Monthly % Removal	Monthly % Removal Ranges
Total Organic Carbon	50	53	53 - 68

Finished water and source water samples are collected and analyzed monthly to calculate percent removal. Total organic carbon includes numerous chemicals that are found naturally in surface waters. Certain chemicals found in this group are precursors to the disinfection byproducts trihalomethanes and haloacetic acids.

Turbidity			
Highest Single Measurement (Cannot exceed 1NTU)	Lowest Monthly % of Samples Meeting Turbidity Limit (0.3 NTU in 95% of samples)		Violation
0.22	100		No

Turbidity is a measure of the apparent cloudiness of water, usually attributed to particulate matter. The turbidity data in the chart above is measured from the water plant tap every 4 hours. Turbidity is monitored throughout each stage of the treatment process in 4 hour intervals. During a final stage of treatment, filtration, turbidity is monitored continuously with in-line meters, and verified every 4 hours in the laboratory.

In 2014, the EPA required the City of Flint and other communities to conduct further testing on unregulated contaminants. Samples were collected at the treatment plant and the maximum residence time location in the distribution system. The monitoring results will be utilized by the EPA to determine if these chemicals should be regulated. The unregulated contaminant monitoring that yielded results are presented in the chart below

Unregulated Contaminant Monitoring			
Regulated Contaminant	Unit of Measure	Highest Level Detected	Range of Detection
Chromium	ug/L	0.40	ND ~ 0.4
Hexavalent Chromium	ug/L	0.40	0.34 ~ 0.40
Strontium	ug/L	130	120 ~ 130
Vanadium	ug/L	0.20	ND ~ 0.20

## 2014 Regulated Detected Contaminants Monitored in Distribution System

Disinfectant Residuals						
Regulated Contaminant	Unit of Measure	<del>MCL</del>	<del>MCL</del>	Highest Level Detected	Range of Detection	Violation
Total Chlorine Residual	mg/L	4.0	4.0	3.5	0.1 - 3.5	No

Microbiological Contaminants				
Regulated Contaminant	<del>MCL</del>	<del>MCL</del>	Highest Number detected (in 1 month)	Violation
Total Coliform bacteria	0	The presence of coliform bacteria in > 5% of monthly samples	15	Yes
<i>E. coli</i> Bacteria	0	0	1	Yes

Disinfectant residuals and microbiological contaminants are monitored at 8 locations throughout the city distribution system, and at the 2 drinking water reservoirs and pump stations located out in the distribution system. At least 100 samples are collected and analyzed each month.

Lead & Copper						
Regulated Contaminant	Unit of Measure	<del>MCL</del>	Action Level	90 <sup>th</sup> Percentile Value	Number of samples over AL	Violation
Lead	ug/L	0	15	6	2	No
Copper	mg/L	1.3	1.3	0.11	0	No

Lead and copper monitoring was conducted from June through December 2014 with the collection of 100 samples. Samples were collected by residents from the taps at their residence. Thank you to all who participated in collecting samples.

Disinfection By-Products						
Regulated Contaminant	Unit of Measure	<del>MCL</del>	<del>MCL</del>	Highest Level Detected	Range of Detection	Violation
Total Trihalomethanes (TTHM)	ug/L	n/a	80	196	33.3 - 196.2	Yes
Halocetic Acids (HAA)	ug/L	n/a	60	64	5 - 64	No
Bromate	ug/L	10	10	23	ND - 23	No

Disinfection by-products occur as a result of the water treatment process. Bromate is formed as a result of using ozone as a treatment additive. Ozone is used to help control taste and odor issues, and as a pre-treatment disinfection. Naturally occurring bromide reacts with Ozone to generate bromate. Bromate is monitored monthly at the treatment plant, and compliance is based on a yearly average.

TTHM's and HAA's are formed as a result of utilizing chlorine in the treatment process. Naturally occurring compounds known as TOC's (total organic carbon) react with chlorine to form TTHM's and HAA's. The temperature and the age of water increase the formation of THM's and HAA's, and as a result, during the warm months of the year is when levels were at their highest. Samples are tested quarterly from 8 sites throughout the distribution system and compliance is based on a running annual average for each individual site.

## General Information (cont.)

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Infants and young children are typically more vulnerable to lead in drinking water than the general population. It is possible that the lead levels at your home may be higher than at other homes in the community as a result of materials used in your home's plumbing. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Flint Department of Utilities is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. If you are concerned about elevated lead levels in your home's water, you can minimize your potential exposure to lead in your water by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

## Current Drinking Water Issues

The City of Flint experienced drinking water issues in the summer of 2014. Issues began with areas of the city experiencing "rusty" water. This was largely due to the city distribution system, which contains hundreds of miles of cast iron pipe. As these pipes age and degrade, iron is released, causing the water to exhibit color. Other contributors to this issue include water main breaks and repairs, routine distribution system maintenance, and a source water change which exposed the pipes to a slightly different water chemistry.

The City of Flint received violations from the Michigan Department of Environmental Quality (MDEQ). A violations for total coliforms and *E. coli* in September, and a corresponding total trihalomethane (TTHM) violation in December. As routine sample site testing in the city distribution system began to detect bacteria, system flushing increased, and chlorine addition at the water treatment plant also increased. The resulting increased chlorine addition then resulted in the higher formation of THM's through the warm weather months.

While facing these issues, the City of Flint took steps to confer with industry professionals and state regulators in regards to treatment plant operation and distribution system operation. In the fall, as water temperatures dropped, and improvements were completed in the distribution system, THM levels were below the maximum contaminant level during routine November monitoring at 7 of the 8 monitoring sites.

## Moving Forward

The City of Flint has taken many steps to help correct the underlying issues that resulted in drinking water violations. Water treatment plant and distribution system corrective actions that were taken or are currently in progress include:

- Limiting the use of storage reservoirs during the warm weather months.  
Warm water temperatures and water age are large contributors to the formation of THM's.
- Optimizing ozone pretreatment by updating control programming along with cleaning and inspection of the ozone generators. Ozone is a powerful oxidant that provides a level of disinfection along with a low residual and odor control.

Key to the Detected Contaminant Tables		
Symbol	Abbreviation for	Definition/Explanation
>	Greater than	
AL	Action Level	The concentration of a contaminant, which, if exceeded, triggers treatment or other requirements which a water system must follow.
HAA5	Haloacetic Acids	HAA5 is the total of bromoacetic, chloroacetic, dibromoacetic, dichloroacetic, and trichloroacetic acids. Compliance is based on the total.
LRAA	Locational Running Annual Average	
MCL	Maximum Contaminant Level	The highest level of a contaminant that is allowed in water. MCLs are set as close to the MCLG's as feasible using the best available treatment technology.
MCLG	Maximum Contaminant Level Goal	The level of contaminant in drinking water below which there is no known or expected risk to health.
mg/L	Milligrams per Liter	A milligram = 1/1000 gram 1 milligram per liter is equal to 1ppm
MRDL	Maximum Residual Disinfectant Level	The highest level of disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
MRDLG	Maximum Residual Disinfectant Level Goal	The level of a drinking water disinfectant below which there is no known or expected risk to health. MRLDG's do not reflect the benefits of the use of disinfectants to control microbial contaminants.
n/a	Not Applicable	
ND	Not Detected	
NTU	Nephelometric Turbidity Units	Measures the cloudiness of water.
pCi/L	Picocuries per Liter	A measure of radioactivity. Picocurie (pCi) means the quantity of radioactive material producing 2.22 nuclear transformations per minute.
ppb	Parts Per Billion (one in one billion)	The ppb is equivalent to micrograms per liter. A microgram = 1/1000 milligram.
ppm	Parts Per Million (one in one million)	The ppm is equivalent to milligrams per liter. A milligram = 1/1000 gram.
RAA	Running Annual Average	
TT	Treatment Technique	A required process intended to reduce the level of a contaminant in drinking water.
TTHM	Total Trihalomethanes	Total Trihalomethanes is the sum of chloroform, bromodichloromethane, dibromochloromethane and bromoform. Compliance is based on total.
ug/L	Micrograms per Liter	A microgram = 1/1,000,000 gram 1 microgram per liter is equal to 1ppb

## Water Quality Update

Dear City of Flint Resident:

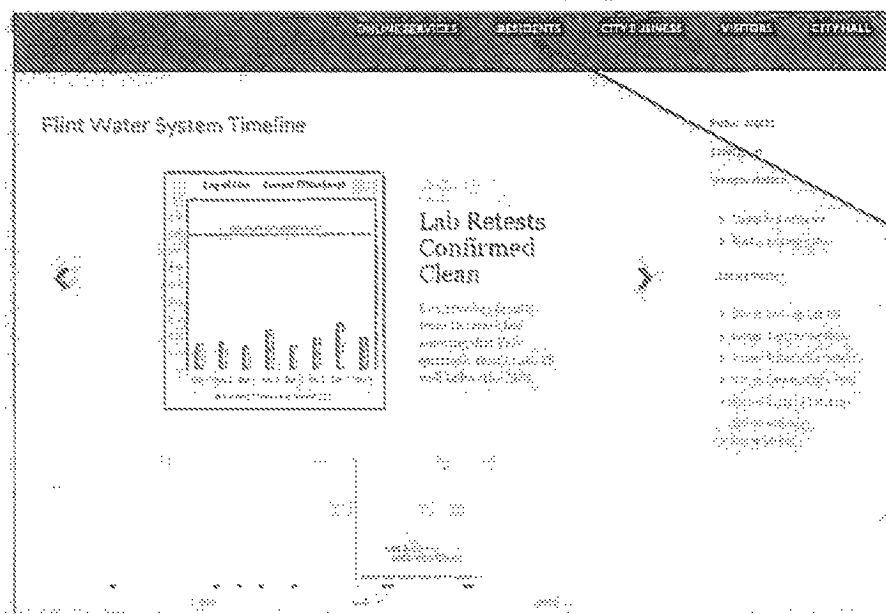

We are pleased to report that City of Flint water is safe and meets U.S. Environmental Protection Agency guidelines. For the second quarter of testing in a row, all eight testing locations in the city have proven to be below the maximum allowable levels for total trihalomethanes (TTHM). While we continue to work on improving aesthetic qualities, such as discoloration or odor, you can be confident that the water provided to you today meets all safety standards. Maintaining safety and quality in our water is a top priority of the City of Flint.

We accomplished this by:

- Upgrading the ozone treatment process at the Water Treatment Plant
- Increasing water main/hydrant flushing to reduce stagnation
- Conducting additional testing of treatment to identify areas of improvement
- Improving water circulation by repairing valves and adjusting reservoir levels

More improvements are being made every day to maintain a healthy system, provide quality water and inform residents of the progress made:

- So far 2100 of the City's 7000 valves have been exercised to determine functionality and if repairs are needed.
- The Granulated Activated Carbon (GAC) filter is on schedule to be installed by mid-July and will have a significant effect on further lowering TTHM.
- A new page has been developed for the City of Flint website designed to keep residents informed of water related stories and progress (shown below).

<https://www.cityofflnt.com/public-works/city-water-system-timeline/>

City of Flint

# Water Quality Update

The Michigan Department of Environmental Quality (MDEQ) has acknowledged our progress:

*"We are encouraged by the results from the most recent round of compliance samples collected on May 18, 2015, which again show individual TTHM levels at below the 0.080 mg/L standard at all locations throughout the City's system. Operational Evaluation Reports from December 2014, February 2015, and May 2015 have identified possible causes and corrective measures for the previous elevated TTHM levels, which we encourage the City to continue implementing."*

-MDEQ

Notification is based on four quarters of test results. Because of last year's test results, for the City's annual quarterly testing average is not yet below the state's allowable average and the City is required to issue the attached notice (**"Important Information about Your Drinking Water"**). There is currently one testing site in the city that is still above the average due to the high levels it experienced in 2014.

Sample Location	5/21/2014	8/21/2014	11/21/2014	2/17/2015	5/18/2015	LRAA*
Water Treatment Plant Tap	56	86	33	8	26	41.8
1. 3719 Davison Rd. McDonalds	162.4	145.1	58.6	16.2	51.4	67.9
2. 822 S. Dort Hwy. BP Gas Station	75.1	33.2	36.2	19.9	46.1	53.6
3. 5302 S. Dort Hwy. Liquor Palace	113.5	127.1	33.3	16.8	69.5	60.2
4. 3606 Corunna Rd. Taco Bell	79.2	181.3	33.9	18.1	54.7	72
5. 2501 Flushing Rd. University Market	106.4	199.2	93.6	24.5	59.8	93.5
6. 3216 Martin Luther King Ave. Salem Housing	82.2	102.4	50.1	28.5	72.7	65.9
7. 5018 Clio Rd. Rite Aid	68.2	144.4	53.6	19.2	60.5	68.4
8. 6204 W. Saginaw St. North Flint Automotive	96.5	118.3	41.1	14.8	45.2	54.9

\* Long Running Annual Average

Average is below Acceptable Level (80ppm) at all but one site

If you have any questions about this report or would like a test done at your home, free of charge, please call us at 810-787-6537.

Maintaining safe water and improving its quality is a top priority for all of us at the City of Flint, and we apologize for the concerns these notices have raised. We have taken many steps to improve the safety and quality of our water supply and will be taking more. Every day work is being done to ensure a well maintained water system for all of our customers. Please track our progress on our website [cityofflint.com/public-works/water-quality-concerns/](http://cityofflint.com/public-works/water-quality-concerns/).

City of Flint

## IMPORTANT INFORMATION ABOUT YOUR DRINKING WATER

### City of Flint Did Not Meet Treatment Requirements

Our water system recently violated a drinking water standard. Although this incident was not an emergency, as our customers, you have a right to know what happened and what we are doing to correct this situation.

We routinely monitor for the presence of drinking water contaminants. Samples were collected for total trihalomethanes (TTHM) analysis from eight locations on a quarterly basis (August 21, November 20 of 2014, and February 17 & May 18 of 2015). The average of the results at ANY of the eight locations must not exceed the maximum contaminant level (MCL) for TTHMs, otherwise our water system exceeds the MCL. The standard for TTHMs is 80 micro grams per liter ( $\mu\text{g/L}$ ). The location reporting the highest TTHM level was 94  $\mu\text{g/L}$ ; thus, our water system exceeds the TTHM MCL.

#### What should I do?

- There is nothing you need to do unless you have a severely compromised immune system, have an infant, or are elderly. These people may be at increased risk and should seek advice about drinking water from their health care providers.
- You do not need to boil your water or take other corrective actions. If a situation arises where the water is no longer safe to drink, you will be notified within 24 hours.

#### What does this mean?

This is not an emergency. If it had been an emergency, you would have been notified within 24 hours.

*People who drink water containing trihalomethanes in excess of the MCL over many years may experience problems with their liver, kidneys, or central nervous system, and may have an increased risk of getting cancer.*

#### What is being done?

We are currently working on solutions to correct the problem. We anticipate resolving the problem in 2015. Our most recent individual sample results were all less than the 80  $\mu\text{g/L}$  standard, however since compliance is calculated using a locational running annual average (LRAA) of the most recent four quarters, we are still out of compliance with the MCL at one of eight locations.

For more information, please contact Mr. Brent Wright at 810-767-6537, or the Flint Water Plant at 4500 North Dort Highway, Flint, Michigan 48505.

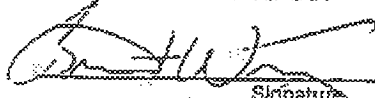

*Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.*

This notice is being sent to you by the City of Flint.

CERTIFICATION: F2/S3

WSSN: 02310

I certify that this water supply has fully complied with the public notification requirements in the Michigan Safe Drinking Water Act, 1976 PA 399, as amended, and the administrative rules.

**For Immediate Release**

**City of Flint Boil Water Advisory Still in Effect for Area Affected by  
Discovery of Abnormal Water Sample**

*Flint, Michigan – August 18, 2014* – The City of Flint's Utilities Department has received word today from the Department of Environmental Quality that the boil water advisory issued for a small portion of the city is still in effect although additional testing has shown no signs of E-coli or fecal coliform bacteria in the water. Testing over the last 48 hours has shown that the water tests negative for the presence of fecal coliform bacteria and E-coli, but an abnormal test result triggered the advisory. It is believed that a sampling error is to blame for the abnormal test; however, as a precaution, the advisory will remain in effect until the next citywide sampling has been completed. The next round of routine testing will take place on Tuesday, August 19, 2014 with the possibility that the advisory could be lifted as early as Wednesday, August 20, 2014.

Testing of the drinking water is a part of the routine process for ensuring the quality and safety of the system which happens weekly at nine different sites around the city. Drinking water contamination due to E-coli or coliform bacteria is very rare due to the fact that the bacteria cannot survive in the water for very long. The colder temperature

**—CONTINUE—**

CITY OF FLINT  
OFFICE OF EMERGENCY MANAGER  
DARNELL EARLEY  
ICMA-CM, MPA

of water in the system coupled with the regular blending of chlorine into the water makes for a hostile environment for these kinds of bacteria. The Flint Water Treatment Plant works diligently to provide water of the highest quality to everyone in the city.

**For Immediate Release**

**City of Flint Boil Water Advisory in Effect for Area Affected  
Due to Abnormal Water Sample**

*Flint, Michigan – September 5, 2014 –* The City of Flint's Utilities Department in conjunction with the Department of Environmental Quality has issued a boil water advisory for a portion of the city. The boil water advisory is in effect for the area bordered by Dayton Street on the north, DuPont Street on the east, the Flint River on the south, and by Lavelle Road (to the Flint River) on the west. Testing over the last 48 hours has shown that the water in the area above tests positive for the presence of total coliform bacteria. Residents in the area should continue to boil water or use bottled water for drinking, bathing, making ice, brushing teeth, washing dishes, and preparing food until further notice. Boiling the water kills bacteria or other harmful organisms.

Total coliform bacteria are generally not harmful themselves. Coliforms are bacteria which are naturally present in the environment and are used as an indicator that other, potentially-harmful, bacteria *may be present*. Usually, coliforms are a sign that there could be a problem with the treatment or distribution system (pipes).

–CONTINUE–

CITY OF FLINT  
OFFICE OF EMERGENCY MANAGER  
DARNELL EARLEY  
ICMA-CM, MPA

Whenever we detect coliform bacteria in any sample, we do follow-up testing to see if other bacteria of greater concern, such as fecal coliform or E. coli, are present. We did not find any of these bacteria in our subsequent testing. If we had, we would have notified you immediately. However, we are still finding coliforms in the drinking water.

The City of Flint Utilities Department will be flushing the system in that part of the city and increasing the chlorine added to water in the area. The City anticipates that the problem will be resolved within the next three days, which is the minimum amount of time for a boil water notice. All water testing results at the City of Flint Water Treatment Plant have shown the City's drinking water meets all Safe Water Drinking Standards. Testing of the drinking water is a part of the routine process for ensuring the quality and safety of the system which happens weekly at ten different sites around the city. Anyone with questions about the advisory or any other water issues should call 810-787-6537.

**SPECIAL NOTE**

This American National Standard (ANS) is a national voluntary consensus standard developed under the auspices of ASHRAE. Consensus is defined by the American National Standards Institute (ANSI), of which ASHRAE is a member and which has approved this Standard as an ANS, as "substantial agreement reached by directly and materially affected interest categories. This signifies the concurrence of more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that an effort be made toward their resolution." Compliance with this Standard is voluntary unless a legal jurisdiction makes compliance mandatory through legislation.

ASHRAE achieves consensus through participation of its national and international members, associated societies, and public review.

ASHRAE Standards are prepared by a Project Committee appointed specifically for the purpose of writing the Standard. The Project Committee Chair and Vice-Chair must be members of ASHRAE; while other committee members may or may not be ASHRAE members, all must be technically qualified in the subject area of the Standard. Every effort is made to balance the concerned interests on all Project Committees.

The Senior Manager of Standards of ASHRAE should be contacted for

- interpretation of the contents of this Standard,
- participation in the next review of the Standard,
- offering constructive criticism for improving the Standard, or
- permission to reprint portions of the Standard.

**DISCLAIMER**

ASHRAE uses its best efforts to promulgate Standards and Guidelines for the benefit of the public in light of available information and accepted industry practices. However, ASHRAE does not guarantee, certify, or assure the safety or performance of any products, components, or systems tested, installed, or operated in accordance with ASHRAE's Standards or Guidelines or that any tests conducted under its Standards or Guidelines will be nonhazardous or free from risk.

**ASHRAE INDUSTRIAL ADVERTISING POLICY ON STANDARDS**

ASHRAE Standards and Guidelines are established to assist industry and the public by offering a uniform method of testing for rating purposes, by suggesting safe practices in designing and installing equipment, by providing proper definitions of the equipment, and by providing other information that may serve to guide the industry. The creation of ASHRAE Standards and Guidelines is determined by the need for them, and conformance to them is completely voluntary.

In referring to this Standard or Guidelines and in marking of equipment and in advertising, no claim shall be made, either stated or implied, that the product has been approved by ASHRAE.

(This foreword is not part of this standard. It is merely informative and does not contain requirements necessary for conformance to the standard. It has not been processed according to the ANSI requirements for a standard and may contain material that has not been subject to public review or a consensus process. Unresolved objections on informative material are not offered the right to appeal at ASHRAE or ANSI.)

## FOREWORD

The purpose of ASHRAE Standard 188 is to establish minimum legionellosis risk management requirements for building water systems.

"Legionellosis" refers to two distinct clinical illnesses. When the bacterium *Legionella* causes pneumonia, the disease is referred to as "Legionnaires' disease" (LD). The Centers for Disease Control and Prevention (CDC) estimates that each year there are between 8000 and 18,000 cases of LD in the United States and that more than 10% of these cases are fatal. *Legionella* can also cause a less-severe influenza-like illness known as "Pontiac fever." Most cases of legionellosis are the result of exposure to *Legionella* associated with building water systems.

The presence of *Legionella* bacteria in building water systems is not in itself sufficient to cause LD. Other necessary factors include environmental conditions that promote the growth of *Legionella*, a means of transmitting the bacteria to people in the building (e.g., aerosol generation), and exposure of susceptible persons to colonized water that is inhaled or aspirated into the lungs. *Legionella* bacteria are not transmitted person-to-person or from normal (nonaspirated) ingestion of contaminated water. Susceptible persons at high risk for legionellosis include but are not limited to the elderly, dialysis patients, persons who smoke, and persons with underlying medical conditions that weaken the immune system.

This standard is intended for use by owners and managers of human-occupied buildings and those involved in the design, construction, installation, commissioning, operation, maintenance, and service of centralized building water systems and components.

Standard 188 consists of numbered normative sections followed by normative and informative annexes. The normative sections and normative annex specify the requirements to comply with this standard. The informative annexes and informative bibliography are provided for guidance that may be helpful for a given building water system. Building water systems vary substantially in their design and their capability for transmission of *Legionella*. Scientific evidence is either lacking or inconclusive in certain aspects of *Legionella* control. Therefore, the informative annexes and informative bibliography in this document provide suggestions, recommendations, and references to guidance.

ASHRAE Standing Standard Project Committee (SSPC) 188 has devoted a considerable amount of time and thought to resolving the concerns of affected and interested parties. The committee thanks everyone who participated in the development of the standard, especially those who made public review comments.

Because changes to improve the standard are anticipated, Standard 188 is now on continuous maintenance, permitting it to be updated through the publication of approved addenda. The planned schedule for republication with approved addenda and errata is anticipated to be every third year.

## 1. PURPOSE

The purpose of this standard is to establish minimum *Legionellosis* risk management requirements for building water systems.

## 2. SCOPE

2.1 This standard provides minimum legionellosis risk management requirements for the design, construction, commissioning, operation, maintenance, repair, replacement, and expansion of new and existing buildings and their associated (potable and nonpotable) water systems and components.

2.2 This standard applies to human-occupied commercial, institutional, multiunit residential, and industrial buildings. This standard does not include single-family residential buildings. Only where specifically noted in this standard shall certain building water systems or parts of building water systems be exempt.

2.3 This standard is intended for use by owners and managers of human-occupied buildings, excluding single-family residential buildings. This standard is also intended for those involved in the design, construction, installation, commissioning, operation, maintenance, and service of centralized building water systems and components.

## 3. DEFINITIONS

**analysis of building water systems:** the systematic evaluation of potentially hazardous conditions associated with each step in the process flow diagrams.

**at-risk:** any person who is more susceptible than the general population to developing legionellosis because of age, health, medication, occupation, or smoking.

**authority having jurisdiction (AHJ):** an organization, office, or individual responsible for enforcing the requirements of this standard.

**beneficial occupancy:** stage of construction when all or part of a building is to be occupied for the purpose for which it was constructed, whether before or after completion.

**building water systems:** potable and nonpotable water systems in the building or on the site.

**centralized building water system:** any system that distributes water to multiple uses or multiple locations within the building or site.

**control:** to manage the conditions of an operation in order to maintain compliance with established criteria.

**control location:** a point where a physical, mechanical, operational, or chemical control measure is required.

**control limit:** a maximum value, a minimum value, or a range of values to which a chemical or physical parameter associated

with a *control measure* must be monitored and maintained in order to reduce the occurrence of a *hazardous condition* to an acceptable level.

*control measure*: a *disinfectant*, heating, cooling, filtering, flushing, or other means, methods, or procedures used to maintain the physical or chemical conditions of water to within *control limits*.

*corrective action*: action to be taken to return control values to within established limits when *monitoring* or measurement indicates the control values are outside the established *control limits*.

*designee*: the individual designated by the building owner to meet the requirements placed on the owner by the standard.

*disinfectant*: chemical agent or physical treatments used to kill or inactivate pathogens.

*disinfection*: the process of killing or inactivating pathogens.

*disinfectant residual*: the net amount of a chemical *disinfectant* remaining in treated water after chemical demand exerted by the water is satisfied.

*hazard*: *Legionella* bacteria in a *building water system* that, in the absence of control, can cause harm to humans.

*hazardous condition*: a condition that contributes to the potential for harmful human exposure to *Legionella*.

*HVAC&R*: heating, ventilating, air conditioning, and refrigeration.

*immunocompromised*: a condition describing an individual who has increased susceptibility to infections due to existing human disease, medication regimens, or other types of medical treatment. (See *at-risk*.)

*Legionella*: the name of the genus of bacteria that was subsequently identified as the causative pathogen associated with the 1976 outbreak of disease at the American Legion convention in Philadelphia. *Legionella* are common aquatic bacteria found in natural and *building water systems*, as well as in some soils.

*legionellosis*: the term used to describe Legionnaires' disease, Pontiac fever, and any illness caused by exposure to *Legionella* bacteria.

*monitoring*: conducting a planned sequence of observations or measurements of the physical and chemical characteristics of *control measures*.

*multiple housing units*: a classification of housing where multiple separate housing units for residential and commercial inhabitants are contained within one building or several buildings within one complex.

*nonpotable*: water that is not safe for drinking or for personal or culinary use and that has the potential to cause harmful human exposure to *Legionella*.

*process flow diagram*: a step-by-step drawing of a *building water system* that includes the location of all water processing steps—including but not limited to conditioning, storing, heating, cooling, recirculation, and distribution—that are part of the *building water systems*.

*potable-water system*: a building water distribution system that provides hot or cold water intended for direct and indirect human contact or consumption.

*Program*: the *water management program*.

*Program Team*: the group or individual designated by the building owner or designee to be responsible for developing, implementing, and maintaining the *Program*.

*risk*: the potential for harm to humans resulting from exposure to *Legionella*.

*risk management*: systematic practices to reduce risk.

*testing*: conducting a planned sequence of observations or measurements of physical, chemical, or microbial characteristics of water to assess whether conditions throughout *building water systems* meet the goals set by the *Program Team*.

*validation*: initial and ongoing confirmation that the *Program*, when implemented as designed, effectively controls the *hazardous conditions* throughout the *building water systems*.

*verification*: initial and ongoing confirmation that the *Program* is being implemented as designed.

*water management program (program)*: the risk management plan for the prevention and control of legionellosis associated with *building water systems*, including documentation of the plan's implementation and operation.

*water service disruption*: planned or unplanned events that reduce water delivery pressure below 20 psi (140 kPa) and that are caused by, but not limited to, new construction de-its; replacement of valves, hydrants, or meters; pumping failures; pipeline breaks; and other system repairs or emergency conditions.

*water use end points*: the points at which water exits from all *potable* and *nonpotable building water systems*, fixtures, and equipment.

#### 4. COMPLIANCE

The results of each Section 4 compliance determination and the associated building survey in Section 5 shall be documented and shall be available for review by the authority having jurisdiction (AHJ).

##### 4.1 Building Designer Requirements

4.1.1 Survey each new building design and its water systems to determine if the design contains any of the devices or factors described in Section 5 that relate to *legionellosis*. If the building and associated property has

- a. any of the *building water systems* in Section 5.1, then all of those *building water systems* shall comply with all applicable requirements of Section 8 of this standard.
- b. any of the factors listed in Section 5.2, then the new building design shall comply with the requirements of Section 8 of this standard.

##### 4.2 Building Owner Requirements

4.2.1 The building owner shall survey each existing building, new building, and any renovation, addition, or modification to an existing building and its water systems as described

in Section 5. The survey and conformance with the compliance requirements of Section 4 must occur prior to occupancy of a new building and before construction begins on renovations, additions, or modifications to existing buildings. If the building and associated property has

- a. any of the *building water systems* listed in Section 5.1, then all of those *building water systems* shall comply with the requirements of Section 6 and all applicable requirements of Section 7 of this standard.
- b. any of the factors listed in Section 5.2, then all *potable building water systems* and all *building water systems* listed in Section 5.1 shall comply with the requirements of Sections 6 and all applicable requirements of Section 7 of this standard.

4.2.2 The building owner shall require the designer of any new building, and any renovation, addition, or modification to an existing building, to follow the requirements of Section 4.1 for the provided design.

4.2.3 The building owner shall conduct and document the compliance determination in Section 4 of this standard at least once per year and any time renovations, additions, or modifications are made to the building.

#### 4.3 Health Care Facility Requirements

4.3.1 Health care facilities that do not meet all of the qualifications of Section 4.3.2 shall comply with the requirements in Sections 4.2, 6, and 7.

4.3.2 Health care facilities that meet all of the following qualifications shall comply with either the requirements in Sections 4.2, 6, and 7 or the requirements in Normative Annex A, "Health Care Facilities":

- a. The health care facility is accredited by a regional, national, or international accrediting agency or by the *authority having jurisdiction (AHJ)* over the health care facility Infection Prevention and Control (IC) activities.
- b. The health care facility IC program has an infection preventionist that is certified in infection prevention control (CIC) by the Certification Board of Infection Control and Epidemiology (CBIC) or other regional, national, or international certifying body, or the health care facility has an epidemiologist with a minimum of a master's degree or equivalent.

### 5. BUILDING SURVEY

5.1 The building shall be surveyed to determine whether it has one or more

- a. open- and closed-circuit cooling towers or evaporative condensers that provide cooling and/or refrigeration for the HVAC&R system or other systems or devices in the building;
- b. whirlpools or spas, either in the building or on the site; or
- c. ornamental fountains, misters, atomizers, air washes, humidifiers, or other *nonpotable* water systems or devices that release water aerosols in the building or on the site.

5.2 The building shall be surveyed to determine whether it is characterized by one or more of the following factors that relate to *legionellasis*:

- a. It includes *multiple housing units* with one or more centralized potable water-heater systems.
- b. It is more than 10 stories high (including any levels that are below grade).
- c. It is a health care facility where patient stays exceed 24 hours.
- d. It is a building containing one or more areas for the purpose of housing or treating occupants receiving treatment for burns, chemotherapy for cancer, or solid organ transplantation or bone marrow transplantation.
- e. It is a building containing one or more areas for the purpose of housing or treating occupants that are *immuno-compromised*, *at-risk*, are taking drugs that weaken the immune system, have renal disease, have diabetes, or have chronic lung disease.
- f. It is a building identified by the owner or *designee* as being for the purpose of housing occupants over the age of 65 years.

### 6. GENERAL REQUIREMENTS

Required compliance with this section shall be determined by Section 4.

6.1 *Principles of a Water Management Program.* A Program utilizing the risk management principles in the following subsections shall be used to reduce the risk of *legionellasis* associated with *building water systems*.

6.1.1 *Analysis of Building Water Systems.* Conduct a systematic analysis of hazardous conditions in the *building water systems*.

6.1.2 *Control Locations.* Determine the locations in the system where control measures are required.

6.1.3 *Control Limits.* For each control measure at each control location established in Section 6.1.2, determine the limits including but not limited to a maximum value, a minimum value, or a range of values within which a chemical or physical parameter must be monitored and maintained in order to reduce hazardous conditions to an acceptable level.

6.1.4 *Monitoring.* Establish a system for monitoring the parameters associated with the control limits established in Section 6.1.3.

6.1.5 *Corrective Actions.* Establish the corrective actions to be taken when monitoring indicates that the control parameters are outside of the established control limits.

6.1.6 *Confirm Program Implementation.* Establish procedures to confirm that all of the Program elements are being implemented as designed.

6.1.7 *Documentation and Recordkeeping.* Establish documentation concerning all procedures, and maintain records appropriate to these principles and their application.

6.2 *Program Development.* When the building survey required by Sections 4 and 5 indicates the presence of one or more of the *building water systems* listed in Section 5.1 but none of the factors listed in Section 5.2, a program shall be

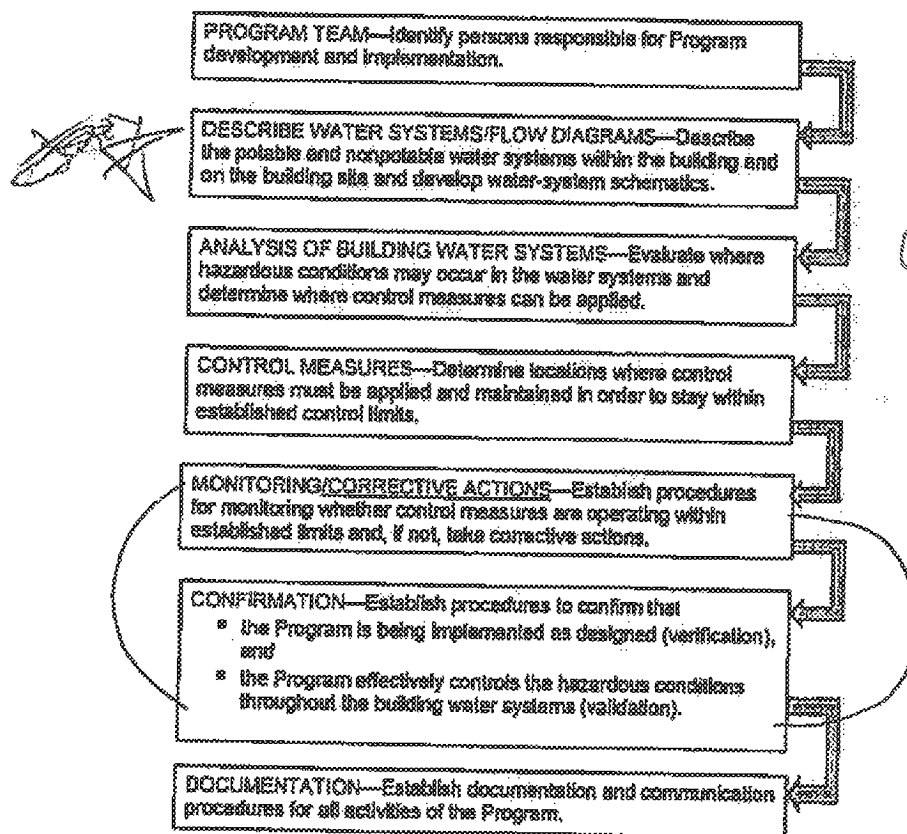

FIGURE 1 Elements of a water management program.

implemented to manage the risk of *legionellosis* for those building water systems listed in Section 5.1. When the building survey required by Sections 4 and 5 indicates the presence of one or more of the factors listed in Section 5.2, a Program shall be implemented to manage the risk of *legionellosis* for potable building water systems and for building water systems listed in Section 5.1. A summary of the program development steps are represented in Figure 1. The Program shall be detailed in a plan that embodies all of the principles described in Section 6.1 and shall include the elements described in the following subsections.

**6.2.1 Program Team.** Identify the persons on the Program Team responsible for developing and implementing the Program and the tasks for which they are responsible. The Program Team shall include one or more individuals selected from the following: the building owner or designer, employees, suppliers, consultants, or other individual or individuals to whom the building owner has delegated authority and responsibility for the actions required by the Program. The Program Team can delegate Program tasks to subgroups. The Program Team shall have knowledge of the building water system design and water management as it relates to *legionellosis* that can be obtained through informative documents,

such as ASHRAE Guideline 12, *Minimizing the Risk of Legionellosis Associated with Building Water Systems*.

**6.2.2 Describe the Building Water Systems.** The Program Team shall identify and describe the potable and nonpotable water systems within the building and on the building site, including (at a minimum)

- the locations of end-point uses of potable and nonpotable water systems,
- the location of water processing equipment and components, and
- how water is received and processed (conditioned, stored, heated, cooled, recirculated, and delivered to end-point uses).

**6.2.3 Process Flow Diagrams.** The information from Section 6.2.2 must be graphically described in step-by-step process flow diagrams. The process flow diagrams shall have sufficient detail to enable the identification, analysis, and management of the risk of *legionellosis* throughout the building water systems. The Program Team shall confirm that the process flow diagrams are representative of the systems as built.

**6.2.4 Analysis of Building Water Systems.** The Program Team shall use the process flow diagrams in Section 6.2.3 to

evaluate where hazardous conditions may occur in the building water systems and determine where control measures can be applied to control potentially hazardous system conditions. The analysis shall also take into consideration the vulnerability of occupants and shall include the building water systems identified in Section 5.1. The analysis shall include provisions to respond to water service disruptions.

**6.2.5 Control Measures.** Based on the results of the analysis of building water systems in Section 6.2.4, the Program Team shall determine the control measures to be maintained. Control measures shall include preplanning of physical design and equipment siting. Control measures shall include treatment methods, technical and physical processes, and procedures and activities or actions that monitor or maintain the physical or chemical conditions of water to within established control limits.

- a. **Control Locations.** The Program Team shall determine the locations in the building water system where control measures are required.
- b. **Control Limits.** The Program Team shall determine a maximum value, minimum value, or range of values to which a chemical or physical parameter must be maintained.

**6.2.6 Monitoring.** The Program Team shall establish a system for monitoring whether the measured physical and chemical characteristics of control measures are within the control limits. The system shall include the means, methods, and frequency for monitoring activities.

**6.2.7 Corrective Actions.** For each control location, the Program Team shall establish procedures for corrective actions to be taken when monitoring shows that control measures are outside of established control limits, shall identify the person responsible for taking the corrective action, shall identify the required response time for taking the corrective action, and shall identify all persons to be notified.

**6.2.8 Program Confirmation.** The Program Team shall establish procedures to confirm, both initially and on an ongoing basis, that the Program is being implemented as designed (verification). The Program Team shall establish procedures to confirm, both initially and on an ongoing basis, that the Program, when implemented as designed, effectively controls the hazardous conditions throughout the building water systems (validation). The Program Team shall determine whether testing for *Legionella* shall be performed and if so how test results will be used to validate the Program. If the Program Team determines that testing is to be performed, the testing approach, including sampling frequency, number of samples, locations, sampling methods, and test methods, shall be specified and documented. The Program Team shall include consideration of the following as part of the determination of whether to test for *Legionella*:

- a. Program control limits are not maintained in building water systems, including in water systems with supplemental disinfection.
- b. A health care facility provides in-patient services to at-risk or immunocompromised populations.
- c. A prior history of legionellosis is associated with the building water system.

**6.2.9 Documentation and Communication.** The Program Team shall establish documentation and communication procedures for all activities of the Program. The Program Team is responsible for all water systems and for communication and coordination among subgroups covering different portions of the building water system and associated equipment. A master document providing the location of all Program documents shall be maintained.

## 7. REQUIREMENTS FOR BUILDING WATER SYSTEMS

All water treatments implemented in connection with this standard shall be applied in conformance with, and shall comply with, all applicable national, regional, and local regulations.

*Informative Note:* Recommendations and guidance on the design, maintenance, and operation of building water systems are provided in ASHRAE Guideline 12, *Minimizing the Risk of Legionellosis Associated with Building Water Systems*.

Required compliance with the following sections shall be determined by Section 4.

- a. Section 7.1, "Potable Water Systems"
- b. Section 7.3, "Cooling Towers and Evaporative Condensers"
- c. Section 7.3, "Whirlpool Spas"
- d. Section 7.4, "Ornamental Fountains and Other Water Features"
- e. Section 7.5, "Aerosol-Generating Mistlers, Atomizers, Air Washers, and Humidifiers"

**7.1 Potable Water Systems.** This section describes the preventive measures required for potable water systems. The program documents shall include identification of the responsible persons for every step of each Program requirement.

*Informative Note:* Recommendations and guidance on the design, maintenance, and operation of building water systems are provided in ASHRAE Guideline 12, *Minimizing the Risk of Legionellosis Associated with Building Water Systems*.

**7.1.1 System Start-Up and Shutdown.** The Program documents shall include procedures for

- a. flushing and disinfection before commissioning any new system;
- b. shutdown, including any draining, purging, cleaning treatment, and control settings;
- c. any unplanned loss of operating energy, loss of water treatment chemicals, or system component repair or replacement;
- d. restarting safely from a drained shutdown condition and from an undrained shutdown condition;
- e. monitoring and treatment following water supply interruptions or breaks in water supply piping; and
- f. reestablishing required temperatures throughout the hot water distribution system.

**7.1.2 System Maintenance.** The Program documents shall include procedures for

- a. inspection of, and inspection schedule for, water-containing vessels and system components;
- b. flushing or mixing of stagnant or low-flow areas;
- c. maintenance and monitoring procedures based on equipment manufacturers' recommendations for cleaning, dis-

infection, replacement of system components, and other treatments that the *Program Team* decides are necessary for the following:

1. Hot water and cold water storage tanks
  2. Ice machines
  3. Water-hammer arrestors
  4. Expansion tanks
  5. Water filters
  6. Shower heads and hoses
  7. Electronic faucets
  8. Aerators
  9. Faucet flow restrictors
  10. Nonsteam aerosol-generating humidifiers
  11. Water heaters
  12. Infrequently used equipment, including eyewash stations and showers
  13. Other equipment identified by the *Program Team*;
- d. maintaining and storing instructions and forms for inspection notes and a *corrective action* log; and
- e. maintaining and storing component and equipment operating manuals.

7.1.3 **Water Treatment.** The *Program* documents shall include

- a. monitoring method and schedule for temperature measurement in the hot water and cold water system;
- b. monitoring method and schedule for measuring the chemical *disinfectant residual* or physical parameters in the hot water and cold water system;
- c. procedures to address water supply interruptions or breaks in water supply piping;
- d. procedures and schedule for maintaining water treatment system *disinfectants*; and
- e. water treatment products, the procedures for their application, and confirmation that the products comply with applicable regulations.

7.1.4 **Contingency Response Plan.** For both hot water and cold water systems, the *Program* documents shall include

- a. procedures to be followed if there are known or suspected cases of *legionellosis* associated with the use of *potable water* from the *building water system*;
- b. directives issued by national, regional, and local health department authorities;
- c. if the *Program Team* determines testing for *Legionella* shall be performed, the procedures shall include criteria for when and where the tests shall be performed;
- d. procedures for emergency *disinfection*; and
- e. procedures for other actions identified as necessary by the *Program Team* to prevent exposure to contaminated water.

7.2 **Cooling Towers and Evaporative Condensers.** This section describes the preventive measures required for cooling towers and evaporative condensers that provide cooling and/or refrigeration for the H/VAC&R system or for other devices or systems in the building. The *Program* documents shall include identification of the responsible persons for every step of each *Program* requirement.

*Informative Note:* Recommendations and guidance on the design, maintenance, and operation of *building water systems* are provided in ASHRAE Guideline 12, *Minimizing the Risk of Legionellosis Associated with Building Water Systems*.

7.2.1 **Equipment Siting.** Prior to the beginning of construction of new or replacement open-circuit cooling towers, closed-circuit cooling towers, or evaporative condensers, drawings shall be reviewed and the following items shall be addressed:

- a. Potential contamination from building systems or facility processes to be drawn into the equipment
- b. Potential for equipment to discharge into occupied spaces, trafficable areas, pedestrian thoroughfares, outdoor air intakes, and building openings
- c. Potential for equipment siting that inhibits access to the equipment for the required maintenance and inspection consistent with the manufacturer's instructions and guidelines

7.2.2 **New-System Start-Up.** The *Program* document shall include procedures for cleaning steps that are part of commissioning of the cooling system. The *Program* document shall also include procedures for management and control means of ensuring that ongoing water treatment is initiated immediately once the system is charged with water.

7.2.3 **System Maintenance.** The *Program* documents shall include

- a. a schedule for inspection of general system cleanliness, of drift eliminator condition and fill material condition, and of water distribution system operation;
- b. requirements and schedule for basin or remote sump cleaning and purging of stagnant or low-flow zones; and
- c. documentation requirements.

7.2.4 **Water Treatment.** The *Program* documents shall include the water treatment requirements to control microbiological activity, scale, and corrosion and shall also

- a. specify all equipment and chemicals used for the purpose of treating the open recirculating loop;
- b. include the minimum required schedule for inspection, maintenance and *monitoring*, and a *corrective actions* plan; and
- c. identify the minimum requirements for documenting system water treatment.

7.2.5 **Shutdown and Start-Up.** The *Program* documents shall include start-up and shutdown requirements to manage *hazardous conditions* associated with operation of fans during untreated water conditions and procedures for

- a. shutdown that includes all chemical pretreatment steps, pump cycling protocols, and procedures for system drainage for shutdown periods longer than the duration specified by the *Program Team*;
- b. start-up from a drained system; and
- c. start-up from an undrained (stagnant) system that exceeds the number of idle days specified by the *Program Team*.

7.2.6 **Disinfection of Cooling Towers and Evaporative Condensers.** The *Program* documents shall include proce-

dures and identify the responsible person for initiating the process for

- a. remedial *disinfection* while in operation, including the conditions that require its application; and
- b. emergency *disinfection*, including the conditions that require its application.

**7.2.7 Location of Cooling Tower Makeup Valve.** The Program documents shall include requirements for the location of cooling tower makeup valves and for maintaining compliance with all applicable local, regional, and national codes and regulations for air gaps and backflow preventers and for the height of the discharge outlets and makeup valve over the rim of the overflow in the cooling tower or evaporative condenser cold water basins. If no such codes and regulations exist for the location, then the Program shall include requirements for maintaining compliance with ASME/ANSI A112.1.2<sup>1</sup> for air gaps and for maintaining compliance with codes and regulations applicable to other locations, selected by the owner or designee, for backflow preventers and for the height of the discharge outlets and makeup valve over the rim of the outflow in the cooling tower or evaporative condenser cold water basins.

**7.2.8 Contingency Response Plan.** The Program documents shall include

- a. procedures to be followed if there are known or suspected cases of *Legionellae* associated with the use of cooling towers and evaporative condensers;
- b. directions issued by national, regional, and local health department authorities;
- c. if the Program Team determines testing for *Legionella* or other pathogens shall be performed, procedures shall include criteria for when and where the tests shall be performed, proper sampling procedures, and the interpretation of test results;
- d. procedures for emergency *disinfection*;
- e. procedures for other actions identified by the Program Team to prevent exposure to contaminated water.

**7.3 Whirlpool Spas.** This section describes the preventative measures required for public whirlpool spas. The Program documents shall include identification of the responsible persons for every step of each Program requirement.

*Informative Note:* Recommendations and guidance on the design, maintenance, and operation of building water systems are provided in ASHRAE Guideline 12, *Minimizing the Risk of Legionellosis Associated with Building Water Systems*.

**7.3.1 General.** Public whirlpool spas and their operation shall comply with national, regional, and local codes.

**7.3.2 Bather-Related Requirements.** The Program documents shall include the

- a. allowable bather load for each whirlpool spa,
- b. the procedures for posting and enforcing the allowable bather load for each whirlpool spa, and
- c. the procedures for posting a notice to bathers of the increased health risk related to use of whirlpool spas by individuals who are at-risk or immunocompromised or who have chronic lung disease.

**7.3.3 Filter Operation and Maintenance.** The Program documents shall include procedures for filtration of whirlpool spa water.

**7.3.3.1 Cartridge (Canister) Filters.** The Program documents shall include procedures and schedules for inspection and replacement of cartridge-type filters, pressure gages, valves, and related equipment.

**7.3.3.2 Granular Filters.** The Program documents shall include procedures and schedules for backwashing, inspection, and replacement of granular-type filters, pressure gages, valves, and related equipment.

**7.3.4 Water Quality, Disinfection, and Monitoring.** The Program documents shall include procedures for

- a. the scheduled changing of whirlpool spa water;
- b. maintaining the pH of the water within the range specified by local, regional, and national codes and regulations;
- c. maintaining *disinfectant* levels, the products to be applied, and requirements to follow *disinfectant* label directions;
- d. shock *disinfection* of the whirlpool spa at the end of each day by achieving the *disinfectant* residual and minimum circulation time recommended by the *disinfectant* manufacturer;
- e. maintenance of the *disinfection* system in accordance with the manufacturer's instructions;
- f. a measurement schedule and logbook of all residual *disinfectant* measurements;
- g. recording *corrective actions* in logbooks; and
- h. recording operations in logbooks maintained for the periods specified in local, regional, and national codes and regulations and for at least 12 months and retained for at least an additional 12 months.

**7.3.5 Microbiology.** The Program documents shall include procedures for the microbiological standards required by local, regional, and national health departments that are to be achieved by public whirlpool spas.

**7.3.5.1 Microbiological Testing.** The Program documents shall include procedures for

- a. monthly or more frequent testing of spa water for indicator organisms and pathogens identified by the Program microbiological standards;
- b. maintaining the total heterotrophic aerobic bacteria colony count at or below the maximum level specified by local, regional, and national codes and regulations or  $\leq 200$  CFU/mL if no codes or regulations apply;
- c. maintaining the levels of indicator organisms at or below the standard threshold;
- d. when and where tests shall be performed, proper sampling procedures, and the interpretation of test results should the Program Team determine that testing for *Legionella* or other pathogens is required;
- e. responding to unsatisfactory test results, including *disinfection* record review and repetition of microbiological tests.

**7.3.5.2 When Contamination Is Discovered.** The Program documents shall include procedures to be followed if there is evidence of feces, vomiting, or other gross contamination and shall include procedures for immediately taking

the spa out of use for spa cleaning, for *disinfection* of the entire spa system, and for restoring the spa to service.

**7.3.5.3 Contingency Response Plan.** The Program documents shall include

- a. procedures to be followed if there are known or suspected cases of *legionellosis* associated with the use of whirlpool spas;
- b. directions issued by national, regional, and local health department authorities;
- c. if the Program Team determines testing for *Legionella* shall be performed, procedures shall include criteria for when and where the tests shall be performed, proper sampling procedures, and the interpretation of test results;
- d. procedures for emergency *disinfection*; and
- e. procedures for other actions identified by the Program Team to prevent exposure to contaminated water.

**7.3.6 Operating Manuals.** The Program documents shall include procedures for regularly updating all operating manuals for filters, pumps, and *disinfection* equipment and for maintaining them at a secure location accessible to maintenance personnel.

**7.4 Ornamental Fountains and Other Water Features.** This section describes the preventative measures required for ornamental fountains and other water features that release water aerosols in the building or on the site. The Program documents shall include identification of the responsible persons for every step of each Program requirement.

*Informative Note:* Recommendations and guidance on the design, maintenance, and operation of building water systems are provided in ASHRAE Guideline 12, *Minimizing the Risk of Legionellosis Associated with Building Water Systems*.

**7.4.1 Equipment Siting.** Prior to beginning construction of an ornamental fountain or other water feature, drawings shall be reviewed and the following items shall be addressed:

- a. Potential organic contamination from adjacent sources
- b. Inadequate drains and stagnant areas
- c. Inadequate access to pumps, filters, tanks, and treatment equipment
- d. External heat sources and inadequate airflow that increase the temperature and thereby increase the risk of exposure to *Legionella*

**7.4.2 Operation.** The Program documents shall include a description of the procedures for

- a. draining, cleaning all components, *disinfecting*, and refilling if the water feature is not in operation for periods that exceed the number of idle days specified by the Program Team;
- b. confirming submerged lights will not operate unless the circulating pump is running; and
- c. confirming circulating pumps are running.

**7.4.3 Maintenance.** The Program documents shall include procedures for regular cleaning; for cleaning the visible buildup of dirt, organic matter, or other debris; and for maintaining pumps and filters as recommended by the manufacturer.

**7.4.4 Water Treatment.** The Program documents shall include procedures for

- a. the weekly cleaning, *disinfection* of equipment and components, and replacement of water in systems with total water volume <5 gal (20 L) or for the periodic use of a *disinfectant*, the products to be applied, and a requirement to follow *disinfectant* manufacturer's directions;
- b. the periodic use of a *disinfectant*, the products to be applied, and a requirement to follow *disinfectant* manufacturer's directions for systems ≥5 gal (20 L); and
- c. maintaining water temperature within the control limits in the Program.

**7.4.5 Contingency Response Plan.** The Program documents shall include

- a. procedures to be followed if there are known or suspected *legionellosis* health problems associated with the use of decorative fountains and other water features in building systems;
- b. directions issued by national, regional, and local health department authorities;
- c. procedures that include criteria for when and where tests shall be performed if the Program Team determines that testing for *Legionella* shall be performed;
- d. procedures for emergency *disinfection*; and
- e. procedures for other actions identified by the Program Team to prevent exposure to contaminated water.

**7.5 Aerosol-Generating Misters, Atomizers, Air Washers, and Humidifiers.** This section describes the preventative measures required for misters, atomizers, air washers, and humidifiers that cool or humidify by generating small water droplets discharged into the air. The program documents shall include identification of the responsible persons for every step of each Program requirement.

*Informative Note:* Recommendations and guidance on the design, maintenance, and operation of building water systems are provided in ASHRAE Guideline 12, *Minimizing the Risk of Legionellosis Associated with Building Water Systems*.

**7.5.1 Equipment Siting.** Prior to beginning construction for installation of new or replacement aerosol-generating misters, atomizers, air washers, or humidifiers, drawings shall be reviewed and the following items addressed:

- a. Potential contamination from sources that can be drawn into the system
- b. Inadequate access to pumps, filters, and treatment equipment for maintenance and inspection
- c. External heat sources and inadequate airflow that increase the temperature and thereby the risk of exposure to *Legionella*

**7.5.2 New-System Start-Up.** The Program documents shall have procedures for cleaning that is required when commissioning misters, atomizers, air washers, and humidifiers.

**7.5.3 System Maintenance.** The Program documents shall include procedures for

- a. a maintenance schedule and instructions for maintaining air-washer mist eliminators, evaporative cooler/humidifier media, spray nozzles, water distribution system operation,

and other equipment and components identified by the *Program Team*;

- b. a maintenance schedule and instructions for cleaning basins and remote sumps and for cleaning and purging stagnant and low-flow zones; and
- c. maintenance procedure documentation, inspection notes, and corrective actions.

**7.5.4 Water Treatment.** When water treatment is used, the *Program* documents shall have procedures for

- a. all equipment and chemicals used for the purpose of treating the open recirculating loop;
- b. an inspection and maintenance schedule for the water treatment equipment; and
- c. the schedule for all monitoring required by the water treatment program.

**7.5.5 System Shutdown and Start-Up.** The *Program* documents shall have procedures for

- a. system shutdown, including any required chemical pretreatment or pump cycling, and procedures for shutdown periods that exceed the number of idle days specified by the *Program Team*;
- b. system start-up from a drained condition; and
- c. system start-up from an undrained (stagnant) condition that exceeds the number of idle days specified by the *Program Team*.

**7.5.6 Disinfection.** The *Program* documents shall have procedures for remedial on-line disinfection and the conditions requiring its application and for emergency disinfection and the conditions requiring its application.

**7.5.7 Contingency Response Plan.** The *Program* documents shall include

- a. procedures to be followed if there are known or suspected cases of *legionellosis* associated with the use of aerosol-generating misters, atomizers, air washers, and humidifiers;
- b. directions issued by national, regional, and local health department authorities;
- c. procedures that include criteria for when and where the tests shall be performed if the *Program Team* determines that testing for *Legionella* shall be performed;
- d. procedures for emergency disinfection; and
- e. procedures for other actions identified by the *Program Team* to prevent exposure to contaminated water.

## **8. REQUIREMENTS FOR DESIGNING BUILDING WATER SYSTEMS**

**8.1 General.** When designing for new construction, renovations, refurbishment, replacement, or repurposing of a facility, the following shall be documented:

- a. A system overview and intended mode of system operation
- b. Documentation and design compliance to address *hazardous conditions* for each of the following:
  1. Schematic diagrams of water systems
  2. Monitoring and control diagrams of water systems
  3. Local, regional, and national code compliance

4. Locations of the following points: makeup, flush, sampling, temperature monitoring, and drain
5. Locations of outdoor air intakes
6. Building water equipment
7. Commissioning
8. Operating instructions and procedures
9. Maintenance schedules, frequencies, and procedures
10. No-flow and low-flow portions of the piping and building water systems
11. Impact of heat loss from hot water or heat gain by cold water in piping and water system components
12. Possible cross connections between potable and non-potable water
13. Inadequate access to water expansion tanks, water-hammer arrestors, water storage tanks, water heaters, and other equipment and components containing water

## **8.2 Final Installation Documents**

**8.2.1 Drawings and documents** of the actual installation shall be provided to the building owner or *designee* and shall include

- a. the location of each piece of equipment associated with the building water systems;
- b. a drawing of the water distribution piping system, including system materials, pipe sizes, design flow rates, design temperatures, temperature monitoring points necessary to confirm design temperatures throughout the system, fill provisions, blow-down provisions, makeup provisions, sampling points, treatment points, and drain provisions;
- c. the location of all outdoor air intakes;
- d. size and options for each piece of water system equipment;
- e. applicable control system wiring diagrams, schematics, equipment and component locations, calibration information, and operational sequences;
- f. material specifications for all building water system components;
- g. material specifications for all water systems insulation;
- h. safety data sheets (SDS) for applicable materials used for building water system treatment, cleaning, flushing, disinfecting, and sealing;
- i. installation requirements for all equipment;
- j. start-up requirements for all equipment;
- k. operational requirements for all equipment and systems; and
- l. maintenance procedures for all equipment and water systems, including required actions, frequencies, and durations.

**8.3 Balancing.** All water systems shall be balanced, and a balance report for all water systems shall be provided to the building owner or *designee*.

**8.4 Commissioning.** Detailed instructions for commissioning of all building water systems shall be provided by the designer in the plans and specifications. Commissioning shall include the following:

- a. Procedures for flushing and disinfection
  1. Procedures shall meet the requirements of AWWA C651<sup>2</sup> or AWWA C652<sup>3</sup> or comply with all applicable national, regional, and local regulations.

2. *Disinfection* and flushing shall be completed within three weeks prior to whole or partial *beneficial occupancy*.

i. If *beneficial occupancy* of any part of the building is delayed more than two weeks but less than four weeks after *disinfection*, flushing of all fixtures shall again be completed.

ii. If *beneficial occupancy* of any part of the building is delayed four weeks or more after *disinfection*, the need for *disinfection* and/or flushing for unoccupied areas shall be determined by a *risk assessment* conducted by the water *Program Team*.

- b. Confirmation that *building water system* performance meets design performance parameters documented in Sections 8.2.1 and 8.3

## **NORMATIVE ANNEX A HEALTH CARE FACILITIES**

These requirements are only applicable to health care facilities meeting the qualifications of Section 4.3.2.

### **A1. SUPPLEMENTAL DEFINITIONS FOR TERMS USED IN ANNEX A**

*legionellosis risk management plan*: the documents that contain all information pertaining to the development and implementation of the *legionellosis* risk management activities of a health care facility.

*Designated Team*: the interdisciplinary group with the authority and responsibility for developing and implementing a *legionellosis risk management plan*.

*water system flow diagram*: a step-by-step drawing of a building water system that includes all water processing steps and identifies areas of the health care facility designated for specialized care.

### **A2. DESIGNATED TEAM**

A2.1 Senior organizational leadership shall select the individual responsible for leading the *Designated Team* from the group responsible for compliance with physical environment accreditation standards. The membership of the *Designated Team* shall include but is not limited to

- a. a person with senior organizational leadership authority to make command decisions about water restrictions or other response measures;
- b. a member of the facilities management staff familiar with the building water systems; and
- c. a member of the health care facility Infection Prevention and Control (IC) program who is an infection preventionist certified in infection control (CIC) by the Certification Board of Infection Control and Epidemiology (CBIC) or by an equivalent regional, national, or international body, or who is an epidemiologist with a minimum of a master's degree or equivalent.

A2.2 The *Designated Team* is responsible for developing, implementing, and documenting all applicable requirements of Annex A and any other activities assigned by senior organizational leadership or their designee.

### **A3. WATER SYSTEM FLOW DIAGRAM**

A3.1 The building water systems shall be graphically represented in *water system flow diagrams* that include

- a. all water supply sources;
- b. all water supply service entrances;
- c. all water treatment systems and control measures, including disinfection and filtration;
- d. all water processing steps, including but not limited to receiving, conditioning, storing, heating, cooling, recirculating, and distributing;
- e. all areas where hazardous conditions may contribute to the potential for *Legionella* amplification, including but not limited to

1. all clinical support areas, including dietary and central sterile, and
  2. all patient care areas, including dialysis, respiratory therapy, and hydrotherapy;
- f. all water use and points, including
1. cooling towers,
  2. open water features,
  3. spas and whirlpools,
  4. pools,
  5. ice machines, and
  6. humidifiers; and
- g. other points determined by the *Designated Team*.

### **A4. RISK MANAGEMENT PLAN**

A4.1 The *legionellosis risk management plan* must be contained within one or more documents. These documents are allowed to contain information that is not part of the *legionellosis risk management plan*, and a master document providing the location of all plan documents shall be maintained. The *legionellosis risk management plan* shall include, without being limited to,

- a. the name, title, and contact information for the *Designated Team* leader and the role and contact information for other *Designated Team* members;
- b. the *water system flow diagrams*;
- c. the systematic evaluation of physical and chemical conditions associated with each step in the *water system flow diagrams* to determine where hazardous conditions can occur in the building water systems and where control measures may be applied;
- d. identification of areas with higher probability of infection throughout the facility based on the intended use of water-based processes and the relative vulnerability of patients to *legionellosis* in areas designated for specialized care;
- e. an evaluation of the results of Sections A4.1(c) and A4.1(d) to estimate the likelihood of *legionellosis*;
- f. the procedures required for prevention and control of *legionellosis* associated with the health care facility's building water systems, including
  1. identification of the control locations,
  2. determination of the control limits,
  3. development of monitoring procedures, and
  4. determination of corrective actions;
- g. assignment of responsibility for each action required by the *legionellosis risk management plan*;
- h. documentation of all aspects of the *legionellosis risk management plan*, including development, implementation, verification, and validation;
- i. disease prevention responses to elevated risk through monitoring of disease surveillance, including but not limited to
  1. notification of relevant IC, Environment of Care (EC)/facilities management, and provider staff of any test results that indicate elevated potential for *Legionella* amplification, transmission or infection;

2. procedures to be implemented when monitoring of control measures indicates deviation from control limits; and
  3. a determination if, when, where, and how environmental testing for *Legionella* is to be performed;
- j. actions to be taken if the IC department identifies probable or confirmed legionellosis cases; the actions shall
1. follow established IC processes, including compliance with most recent requirements of the U.S. Centers for Disease Control and Prevention (CDC) or other regional or national authority;
  2. include implementation of remediation actions as necessary;
  3. include evaluation of the legionellosis risk management plan and any necessary changes; and
- k. procedures established by the Designated Team to confirm initially and on an ongoing basis that the legionellosis risk management plan is implemented as designed (verification) and that, when implemented as designed, the legionellosis risk management plan effectively controls the hazardous conditions throughout the building water systems (validation).

#### A5. EXISTING BUILDINGS, NEW CONSTRUCTION, AND RENOVATIONS

**A5.1 Existing Buildings.** The Designated Team shall conduct an evaluation and estimate of the likelihood of legionellosis as specified in Section A4.1(e) at least once per year for each existing building. Based on the results of this evaluation and estimate, the Designated Team shall modify the legionellosis risk management plan as necessary. This process shall be repeated for all affected areas

- a. whenever a building or portion of a building is changed such that one or more water system is affected;
- b. whenever major maintenance to a building water system is performed, including replacing tanks, pumps, heat exchangers, and distribution piping; and
- c. whenever there is a water service disruption from the supplier to the building.

**A5.2** For new construction and renovations, the Designated Team shall review the scope of work and determine the risk associated with the project, and the senior organizational leadership or their designee shall require the building designer and builder

- a. to work cooperatively with the Designated Team to conduct an evaluation and estimate of the likelihood of legionellosis for the project as specified in Section A4.1.5; based on the results of this evaluation and estimate, the Designated Team shall modify the legionellosis risk management plan as necessary for the project (1) during the early planning, (2) during each phase of design and construction, and (3) during commissioning;
- b. to work cooperatively with the Designated Team to comply with all applicable portions of Section 9;

- c. to provide timely documented reports to the Designated Team confirming compliance with the legionellosis risk management plan; and
- d. to provide a commissioning plan.

#### A6. BUILDING WATER SYSTEM PROCEDURES

**A6.1** The legionellosis risk management plan shall include procedures for the following building water systems or shall include a determination and rationale by the Designated Team for any procedures that are not required:

##### a. Potable water systems

1. Systems start-up and shutdown. The legionellosis risk management plan documents shall include procedures for
  - i. flushing and disinfection before commissioning any new system;
  - ii. shutdown, including any draining, purging, cleaning treatment, and control settings;
  - iii. any unplanned loss of operating energy, loss of water treatment chemicals, or system component repair or replacement;
  - iv. restarting safely from a drained shutdown condition and from an undrained (segment) shutdown condition;
  - v. monitoring and treatment following water supply interruptions or breaks in water supply piping; and
  - vi. reestablishing required temperatures throughout the hot water distribution system.
2. System maintenance. The legionellosis risk management plan documents shall include procedures for
  - i. inspection and the inspection schedule for water-containing vessels and system components;
  - ii. flushing or mixing of stagnant or low-flow areas;
  - iii. maintenance and monitoring procedures based on equipment manufacturers' recommendations for cleaning, disinfection, replacement of system components, and other treatments the Designated Team decides are necessary for
    - (a) hot water and cold water storage tanks;
    - (b) ice machines;
    - (c) water-hammer arrestors;
    - (d) expansion tanks;
    - (e) water filters;
    - (f) shower heads and hoses;
    - (g) electronic faucets;
    - (h) aerators;
    - (i) faucet flow restrictors;
    - (j) nonsteam aerosol-generating humidifiers;
    - (k) water heaters;
    - (l) infrequently used equipment, including eye-wash stations and showers;
    - (m) other equipment identified by the Designated Team;
    - (n) maintaining and storing instructions and forms for inspection notes and a correction action log; and
    - (o) maintaining and storing component and equipment operating manuals.

3. Water treatment. The *legionellosis risk management plan* documents shall include

- i. monitoring method and schedule for temperature measurement in the hot water and cold water systems;
- ii. monitoring method and schedule for measuring the chemical *disinfectant residual* or physical parameters in the hot water and cold water system;
- iii. procedures to address water supply interruptions or breaks in water supply piping;
- iv. procedures and schedule for maintaining water treatment system *disinfectants*; and
- v. water treatment products, the procedures for their application, and confirmation that the products comply with applicable regulations.

b. Cooling towers and evaporative condensers. This section describes the preventive measures required for cooling towers and evaporative condensers that provide cooling and/or refrigeration for the HVAC&R systems or for other devices or systems in the building. The *legionellosis risk management plan* documents shall include identification of the responsible persons for every step of each *legionellosis risk management plan* requirement.

1. System maintenance. The *legionellosis risk management plan* documents shall include

- i. a schedule for inspections of general system cleanliness, drift eliminator condition, condition of fill material, and water distribution system operation;
- ii. requirements and the schedule for basin or remote sump cleaning and purging of stagnant or low-flow zones; and
- iii. documentation requirements.

2. Water treatment. The *legionellosis risk management plan* documents shall include the water treatment requirements to control microbiological activity, scale, and corrosion and shall also

- i. specify all equipment and chemicals used for the purpose of treating the open recirculating loop;
- ii. include the minimum required schedule for inspection, maintenance, and monitoring and a *corrective actions plan*; and
- iii. identify the minimum requirements for documenting system water treatment.

3. Shutdown and start-up. The *legionellosis risk management plan* documents shall include start-up and shutdown requirements to manage hazardous conditions associated with operation of fans during untreated water conditions and procedures for

- i. shutdown that include all chemical pretreatment steps, pump cycling protocols, and procedures for system drainage for shutdown periods longer than the duration specified by the *Designated Team*;
- ii. start-up from a drained system; and
- iii. start-up from an undrained (stagnant) system that exceeds the number of idle days specified by the *Designated Team*.

4. Disinfection of cooling towers and evaporative condensers. The *legionellosis risk management plan* doc-

uments shall include procedures and identify the person responsible for initiating the process for

- i. remedial *disinfection* while in operation, including the conditions that require its application; and
- ii. emergency *disinfection*, including the conditions that require its application.

5. Location of cooling tower makeup valve. The *legionellosis risk management plan* documents shall include requirements for the location of cooling tower makeup valves and for maintaining compliance with all applicable local, regional, and national codes and regulations for air gaps and backflow preventers and for the height of the discharge outlets and makeup valve over the rim of the overflow in the cooling tower or evaporative condenser cold water basins. If no such codes and regulations exist for the location, then the *legionellosis risk management plan* shall include requirements for maintaining compliance with ASME/ANSI A112.1.2<sup>1</sup> for air gaps and for maintaining compliance with codes and regulations applicable to other locations, selected by the owner or designer, for backflow preventers and for the height of the discharge outlets and makeup valve over the rim of the outflow in the cooling tower or evaporative condenser cold water basins.

c. Pools and spas. Pools and spas shall be operated and maintained in accordance with original equipment manufacturer (OEM) requirements.

d. Ornamental fountains and open water features

1. Operation. The *legionellosis risk management plan* documents shall include a description of the procedures for

- i. draining, cleaning all components, disinfecting, and refilling if the water feature is not in operation for periods that exceed the number of idle days specified by the *Designated Team*;
- ii. confirming that submerged lights will not operate unless the circulating pump is running; and
- iii. confirming that circulating pumps are running.

2. Maintenance. The *legionellosis risk management plan* documents shall include procedures for regular cleaning: for cleaning the visible buildup of dirt, organic matter, or other debris; and for maintaining pumps and filters as recommended by the manufacturer.

3. Water treatment. The *legionellosis risk management plan* documents shall include procedures for

- i. the weekly cleaning, *disinfection* of equipment and components, and replacement of water in systems with total water volume <5 gal (20 L) or for the periodic use of a *disinfectant*, the products to be applied, and a requirement to follow *disinfectant* manufacturer's directions;
- ii. the periodic use of a *disinfectant*, the products to be applied, and a requirement to follow *disinfectant* manufacturer's directions for systems ≥5 gal (20 L); and
- iii. maintaining water temperature within the *control limits* in the *legionellosis risk management plan*.

#### INFORMATIVE ANNEX C GUIDANCE IF *LEGIONELLA* TESTING IS UTILIZED

When *testing* of environmental water samples is utilized, it should be by a laboratory with demonstrated proficiency in the subject method, such as may be evidenced by certification by a national, regional, or local government agency or by an accredited nongovernmental organization (NGO).

Laboratories performing microbiological culture *testing* of environmental water samples should be accredited by a

regional, national, or international accrediting body according to a nationally or internationally recognized standard, for example ISO/IEC 17025:2005. *Legionella* culture *testing* must be included as well as the laboratory's scope of accreditation.

As part of the laboratory accreditation, laboratories should have demonstrated proficiency in the detection of *Legionella* culture in accordance with one of the following:

- a. U.S. Centers for Disease Control and Prevention (CDC) Environmental *Legionella* Isolation Techniques Evaluation (ELITE) Program
- b. European external quality assessment/proficiency *testing* program for *Legionella* isolation through Public Health England
- c. An equivalent, nationally accredited proficiency test provider

## NOTICE

### INSTRUCTIONS FOR SUBMITTING A PROPOSED CHANGE TO THIS STANDARD UNDER CONTINUOUS MAINTENANCE

This standard is maintained under continuous maintenance procedures by a Standing Standard Project Committee (SSPC) for which the Standards Committee has established a documented program for regular publication of addenda or revisions, including procedures for timely, documented, consensus action on requests for change to any part of the standard. SSPC consideration will be given to proposed changes within 13 months of receipt by the Senior Manager of Standards (SMOS).

Proposed changes must be submitted to the SMOS in the latest published format available from the SMOS. However, the SMOS may accept proposed changes in an earlier published format if the SMOS concludes that the differences are immaterial to the proposed change submittal. If the SMOS concludes that a current form must be utilized, the proposer may be given up to 20 additional days to resubmit the proposed changes in the current format.

### ELECTRONIC PREPARATION/SUBMISSION OF FORM FOR PROPOSING CHANGES

An electronic version of each change, which must comply with the instructions in the Notice and the Form, is the preferred form of submittal to ASHRAE Headquarters at the address shown below. The electronic format facilitates both paper-based and computer-based processing. Submittal in paper form is acceptable. The following instructions apply to change proposals submitted in electronic form.

Use the appropriate file format for your word processor and save the file in either a recent version of Microsoft Word (preferred) or another commonly used word-processing program. Please save each change proposal file with a different name (for example, "prop01.doc," "prop02.doc," etc.). If supplemental background documents to support changes submitted are included, it is preferred that they also be in electronic form as word-processed or scanned documents.

For files submitted attached to an e-mail, ASHRAE will accept an electronic signature (as a picture; \*.tif, or \*.wpg) on the change submittal form as equivalent to the signature required on the change submittal form to convey non-exclusive copyright.

Submit an e-mail containing the change proposal files to:  
[change.proposal@ashrae.org](mailto:change.proposal@ashrae.org)

Alternatively, mail paper versions to:  
ASHRAE  
Senior Manager of Standards  
1791 Tullie Circle, NE  
Atlanta, GA 30329-2305

Or fax them to:  
Attn: Senior Manager of Standards  
404-321-5478

The form and instructions for electronic submittal may be obtained from the Standards section of ASHRAE's Home Page, [www.ashrae.org](http://www.ashrae.org), or by contacting a Standards Secretary via phone (404-636-8400), fax (404-321-5478), e-mail ([standards.section@ashrae.org](mailto:standards.section@ashrae.org)), or mail (1791 Tullie Circle, NE, Atlanta, GA 30329-2305).

## FORM FOR SUBMITTAL OF PROPOSED CHANGE TO AN ASHRAE STANDARD UNDER CONTINUOUS MAINTENANCE

NOTE: Use a separate form for each comment. Submittals (Microsoft Word preferred) may be attached to e-mail (preferred), or submitted in paper by mail or fax to ASHRAE, Senior Manager of Standards, 1791 Tullie Circle, NE, Atlanta, GA 30329-2305. E-mail: [change.proposal@ashrae.org](mailto:change.proposal@ashrae.org). Fax: +1-404-321-5478.

Submitter's signature: \_\_\_\_\_ Date: \_\_\_\_\_

*All electronic submittals must have the following statement completed:*

I insert name through this electronic signature, hereby grant ASHRAE the non-exclusive royalty rights, including non-exclusive rights in copyright, in my proposals. I understand that I acquire no rights in publication of the standard in which my proposals in this or other analogous form is used. I hereby attest that I have the authority and am empowered to grant this copyright release.

### 2. Number and year of standard:

### 3. Page number and clause (section), subclause, or paragraph number:

4. I propose to: ☐ Change to read as follows ☐ Delete and substitute as follows  
(check one) ☐ Add new text as follows ☐ Delete without substitution

Use underlines to show material to be added (added) and strike through material to be deleted (deleted). Use additional pages if needed.

### 5. Proposed change:

### 6. Reason and substantiation:

7. Will the proposed change increase the cost of engineering or construction? If yes, provide a brief explanation as to why the increase is justified.

☐ Check if additional pages are attached. Number of additional pages: \_\_\_\_\_

☐ Check if attachments or referenced materials cited in this proposal accompany this proposed change. Please verify that all attachments and references are relevant, current, and clearly labeled to avoid processing and review delays. Please list your attachments here:

## POLICY STATEMENT DEFINING ASHRAE'S CONCERN FOR THE ENVIRONMENTAL IMPACT OF ITS ACTIVITIES

ASHRAE is concerned with the impact of its members' activities on both the indoor and outdoor environment. ASHRAE's members will strive to minimize any possible deleterious effect on the indoor and outdoor environment of the systems and components in their responsibility while maximizing the beneficial effects these systems provide, consistent with accepted Standards and the practical state of the art.

ASHRAE's short-range goal is to ensure that the systems and components within its scope do not impact the indoor and outdoor environment to a greater extent than specified by the Standards and Guidelines as established by itself and other responsible bodies.

As an ongoing goal, ASHRAE will, through its Standards Committee and extensive Technical Committee structure, continue to generate up-to-date Standards and Guidelines where appropriate and adopt, recommend, and promote those new and revised Standards developed by other responsible organizations.

Through its *Handbook*, appropriate chapters will contain up-to-date Standards and design considerations as the material is systematically revised.

ASHRAE will take the lead with respect to dissemination of environmental information of its primary interest and will seek out and disseminate information from other responsible organizations that is pertinent, as guides to updating Standards and Guidelines.

The effects of the design and selection of equipment and systems will be considered within the scope of the system's intended use and expected misuse. The disposal of hazardous materials, if any, will also be considered.

ASHRAE's primary concern for environmental impact will be at the site where equipment within ASHRAE's scope operates. However, energy source selection and the possible environmental impact due to the energy source and energy transportation will be considered where possible. Recommendations concerning energy source selection should be made by its members.

ASHRAE • 1791 Tullie Circle NE • Atlanta, GA 30329 • [www.ashrae.org](http://www.ashrae.org)

#### About ASHRAE

ASHRAE, founded in 1894, is a global society advancing human well-being through sustainable technology for the built environment. The Society and its members focus on building systems, energy efficiency, indoor air quality, refrigeration, and sustainability. Through research, Standards writing, publishing, certification and continuing education, ASHRAE shapes tomorrow's built environment today.

For more information or to become a member of ASHRAE, visit [www.ashrae.org](http://www.ashrae.org).

To stay current with this and other ASHRAE Standards and Guidelines, visit [www.ashrae.org/standards](http://www.ashrae.org/standards).

#### Visit the ASHRAE Bookstore

ASHRAE offers its Standards and Guidelines in print, as immediately downloadable PDFs, on CD-ROM, and via ASHRAE Digital Collections, which provides online access with automatic updates as well as historical versions of publications. Selected Standards and Guidelines are also offered in redline versions that indicate the changes made between the active Standard or Guideline and its previous version. For more information, visit the Standards and Guidelines section of the ASHRAE Bookstore at [www.ashrae.org/bookstore](http://www.ashrae.org/bookstore).

#### IMPORTANT NOTICES ABOUT THIS STANDARD

To ensure that you have all of the approved addenda, errata, and interpretations for this Standard, visit [www.ashrae.org/standards](http://www.ashrae.org/standards) to download them free of charge.

Addenda, errata, and interpretations for ASHRAE Standards and Guidelines are no longer distributed with copies of the Standards and Guidelines. ASHRAE provides these addenda, errata, and interpretations only in electronic form to promote more sustainable use of resources.

## Minimizing the Risk of Legionellosis Associated with Building Water Systems

**AMERICAN SOCIETY OF HEATING,  
REFRIGERATING AND  
AIR-CONDITIONING ENGINEERS, INC.**  
1791 Tullie Circle, NE • Atlanta, GA 30322

ACTIVE substances and Conditions are established to assist industry and the public in making a uniform interpretation for testing purposes, for recognizing such practices in teaching and research, and for setting proper standards of the equipment, and for providing those standards that may serve to guide the student. The members of AACTE-USA Standards and Conditions are determined by the method for form, and amendments are placed in conformity with the members of AACTE-USA. In referring to the Standards or Conditions and in making of amendments and in conformity, the student shall be made, where appropriate, that the products have been approved by AACTE-USA.

## 1. PURPOSE

The purpose of this guideline is to provide information and guidance in order to minimize *Legionella* contamination in building water systems.

## 2. SCOPE

2.1 This guideline provides specific environmental and operational guidelines that will contribute to the safe operation of building water systems to minimize the risk of occurrence of Legionellosis.

2.2 This guideline is intended for use with nonresidential building systems functioning but not limited to hotels, office buildings, hospitals and other health care facilities, schools, hotels, factories, schools and universities, commercial buildings, industrial buildings, etc.) and controlled systems in multifamily residential buildings including but not limited to central heating/cooling systems, central domestic water systems, common area plumbing, etc.). While not specifically intended for nonresidential or single-family residential building systems, some of the information may be useful for these systems.

2.3 This guideline is intended for the use of designers, installers, owners, operators, users, maintenance personnel, and equipment manufacturers.

## 3. ECOLOGY OF *LEGIONELLA*

### 3.1 Infection and Disease

The majority of *Legionnaires' disease* cases diagnosed and reported to the public health officials are sporadic (i.e., not occurring as part of a recognized outbreak). Compared with airborne-associated infection, much less is known about transmission of sporadic *Legionnaires' disease*. Although it is likely that transmission occurs by similar mechanisms, exposure to legionellae in aquatic environments occurs in a variety of settings, including the home, the workplace, and public places visited during routine daily activities during travel. The propagation of specific diseases attributable to exposure to each of these settings and to various environmental sources is unknown.

*Legionella* are bacteria. When legionellae are present in aquatic environments, the risk of transmission of infection to humans depends on the presence of several factors, conditions favorable for amplification of the organism, a mechanism of dissemination (e.g., aerosolization of contaminated water), invasion of the organism at a site where it is capable of causing infection, bacterial strain-specific virulence factors, and the susceptibility of the host. Other species of *Legionella* have been identified. *L. pneumophila* appears to be the most virulent and is associated with approximately 90% of cases of Legionellosis. *Legionella* *sp.* *L. pneumophila* infection are caused by serogroup 1; however, certain serogroup 1 strains may be more virulent. The risk of acquiring *L. pneumophila* disease is greatest for older persons and for those who smoke tobacco or have chronic lung disease. Persons whose immune system is suppressed by certain drugs or by underlying medical conditions appear to be at particularly high risk.

## 3.2 Habitat

*Legionella* bacteria are commonly present in natural and man-made aquatic environments. The organism is occasionally found in other sources, such as soil from streams and peeling paint, however, the overall importance of nonaquatic environmental sources to human disease is not yet known. In natural water sources and municipal water systems, legionellae are generally present in very low or undetectable concentrations. However, under certain circumstances within nonresidential water systems, the colonization of organisms may become relatively high, a process termed "amplification." Conditions that are favorable for the amplification of *Legionella* growth include water temperatures of 25-42°C (77-108°F), stagnation, scale and sediment buildup, and the presence of nutrients. *Legionella* colonize and multiply within several species of free-living amoebae, as well as other protozoa. The initial site of infection in humans with *Legionnaires' disease* is the pulmonary macrophage. These cells engulf legionellae, provide an intracellular environment that is remarkably similar to that within host protozoa, and allow for multiplication of the bacterium. Factors *Legionella* may be considered pathogenic, i.e., they multiply within free-living amoebae and intracellularly within the phagocytic cells within human lungs under certain circumstances. Although legionellae may be cultured on special agar media in laboratory settings, growth is slower in the absence of protozoa and in the absence of complex nutrient broth. Legionella has not been demonstrated, however, to grow in *Legionella* growth media and within diverse natural building systems may be the primary means of proliferation.

There is no indication that growth of *Legionella* is inhibited by certain minerals, metals, sodium, and some plastics have been shown to support the amplification of *Legionella*, while other materials such as copper inhibit their growth.

Generally, *Legionella* thrive in diverse, complex natural and man-made environments because they require nutrients and protection from the environment. Controlling the population of protozoa and other microorganisms may be the best means of minimizing *Legionella*.

### 3.3 Transmission of *Legionnaires' Disease*

Most data on the transmission of *Legionnaires' disease* are derived from investigation of disease outbreaks. These data suggest that, in most instances, transmission in humans occurs when water containing the organism is aerosolized in respirable droplets (1-5 micrometers in diameter) and inhaled by a susceptible host.

Prior to actual disease a number of events occur, some of which can be influenced by good engineering and maintenance practices. These events and prevention opportunities are outlined in Figure 1. The first event, survival in water, is generally outside the scope of building engineering and maintenance practices. The next three events—amplification, dissemination, and transmission—can be influenced by engineering design and maintenance practices. Subsequent events are influenced by the individual's health.

The most effective control for most diseases, including Legionellosis, is prevention of transmission as at many points

### Figure 8 Direct and indirect effects

Figure 3. Schematic diagram of a water-cooled air washer.

dealing with other space-through building water or air equipment with a recirculating system including a pump, automatic makeup water valve, a bleed-off pump, and a pressure differential sensor.

**8.1.2 Air Washers.** Air washers utilize high-pressure nozzles to reduce water to small droplets for efficient evaporation. These systems have a dedicated or shared condensing coil of front coils of spray nozzles and drift eliminators. Air washers require a pump for collecting and building excess spray water. The distributor section requires constant drops of water from the air washers also utilize either outside through-probe building water or are equipped with a recirculating system including a pump, automatic makeup water valve, a bleed-off pump, and a pressure differential sensor. The water may be chilled for additional cooling and/or dehumidification.

**8.1.3 Blowers.** Blowers provide air removal by use of various devices, spinning disks, or spray nozzles. Various drive devices are equipped with fresh outside water directly from the building water system; however, some systems contain a reservoir.

**8.1.4 Wetted Element and Screen-Type Humidifiers.** Wetted element and screen-type humidifiers convert water to vapor that is distributed into the space being conditioned. Due to the element's surface, the water being converted is not evaporated, thus humidity is not constant and a risk for the growth of *Legionella* during normal operation. However, if the humidifier is properly installed, maintain, and replaced on the last day and lead to bacterial growth. During periods of time where equipment is not in use, all water should be drained from the system to avoid the possibility of bacterial growth.

## 8.2 System Operation

See 8.1.

It should be noted that due to process conditions, there may be periods of time when equipment is shut down. It is common practice to drain equipment when the unit is not in use. In addition, a continuous bleed or purge cycle is usually employed to drain the building of solids and contaminants to the drain. High dilution rates remove bacteria, nutrients, and other contaminants before they are a problem. It is important to maintain *Legionella* to occur under these conditions.

**8.2.1 Water Temperature—Wetted Media Humidifiers, Air-Cooled Humidifiers, and Air Washers.** For wetted media evaporative air coolers/humidifiers and air washers, the recirculating water temperature represents the wet-bulb temperature of the atmosphere in which it is exposed. Since the wet-bulb temperature in most regions where these devices are used is well below 25°C (77°F), the water tends to be maintained at temperatures below the *Legionella* growth temperature range of 25–42°C (77–108°F).

**8.2.2 Water Temperature—Blowers.** For water supplied directly from the building water system, the temperature would tend to be as the supply cold water temperature. If fed from a storage reservoir, or pipes exposed to heat, the temperature could be higher. The temperature could exceed 25°C (77°F), which is favorable for amplification of *Legionella*.

**8.2.3 Water Temperature—Air Washers.** Air washer operating conditions are based on the requirements of the process, however a standard operating temperature range for recirculating water is 4–10°C (40–50°F). The normal operating portions of air washer systems used to be maintained at temperatures below the *Legionella* growth temperature range of 25–42°C (77–108°F).

## 8.3 Water Treatment

**8.3.1 Wetted Media.** Wetted media equipment generally produces fine droplets during operation. However, large droplets form as a result of improper maintenance and uneven water or air distribution. The exact size of the droplets will vary with the distribution of the media and the air flow rate. If water used, air velocity through the unit, and irrigation rate, it should be assumed that under extreme conditions droplets of fine dust or mist may be carried.

**8.3.2 Air Washers.** The major source of droplets being captured into the system are found spray nozzles and blower or spray mist eliminators. Air washers can produce droplets of various sizes and certainly have the potential to produce droplets less than 3 micrometers in diameter.

**8.3.3 Blowers.** These systems can produce droplets of varying size and certainly have the potential to produce droplets less than 3 micrometers in diameter.

## 8.4 Maintenance

Because direct evaporative air coolers/humidifiers are efficient air conditioners and move large volumes of air, regular water and other filters can be accumulated. This may be a major source for *Legionella* growth.

**8.4.1 Wetted Media Evaporative Air-Cooled Humidifiers and Air Washers.** Wetted media evaporative coolers/humidifiers and air washers have potential for growth where dirt, scale, or biological matter can accumulate. Most

likely areas of such accumulation are collection troughs, mist eliminators, or water storage tanks.

**8.4.2 Blowers.** Blowers available for use by industrial water piping. If distribution piping and/or building water is used, maintain the form of sediment and other debris may occur.

## 8.5 Recommended Treatment

**8.5.1 All Systems.** Regular inspection and maintenance of evaporative air coolers/humidifiers, air washers, misters, and auxiliary equipment are recommended. Avoid dead-end piping, low spots, and other areas in the water distribution system where water may stagnate during shutdown.

Consider the use of photochemical water generators to control microbial concentrations in water to tanks and distribution piping. Water filters and air filters should be changed as required. The entire cooling water loop should be cleaned and flushed regularly.

**8.5.2 Recirculating Systems.** Proper pump water level or spray pressure must be maintained. Bleeding air or purging some of the water is the most practical means to minimize scale and mineral accumulation. The bleed rate or purge depends on water quality (including hardness) and substrate concentration level. Regular inspections should be made to ensure that the bleed rate or purge is adequate and is maintained. As an added precaution, pumps could be automatically drained during shutdown of the fan. When it is operational to drain a system down for cleaning, it should be provided with a pressure draining pump and easily accessible flush-out of the water distribution header so it can be flushed during operation. After flushing, the recirculating cooling water with a blower represented by the EPA for such applications.

**8.5.3 Air Washers.** Use corrosion inhibitors to prevent corrosion of metals in the system and formation of corrosion products. Control the level of suspended solids that can support bacteria and growth forms for *Legionella*. Finally, the microbiological activity should be controlled through the utilization of biocides approved by the EPA for such applications.

**8.5.4 Wetted Media Evaporative Air-Cooled Humidifiers.** Media located inside a large build-up of house may not dry completely during period of shutdown (i.e., weekends), resulting in stagnation. In order to dry out the media, pumps should be shut down prior to scheduled fan shutdown. Similar systems that have the media located adjacent to other water systems should be dry sufficiently without assistance. For systems experiencing high humidity, a daily or every 24-hour drying period of time when the system is not in operation. Media should be cleaned or replaced when necessary.

**8.5.5 Misters.** Never recirculate untreated water. Double pump and reservoir when equipment is not in use. For portable misters, drain and disconnect piping and reservoir regularly. Only sterile water should be added to the reservoir if possible. Biocides used to health care environments or in other areas

where immunocompromised persons are likely to be exposed to the generated aerosols.

## 8.6 Blowing

Evaporative air coolers/humidifiers should not be located near the source of a cooling tower, fluid cooler, evaporative cooler, blower exhaust, or any other source of evaporative contamination. Placement upstream of the evaporative air cooler/humidifier is recommended when particulate contamination is expected. Filtration downstream of the evaporative air cooler/humidifier is also recommended to allow absorption of moisture from the air stream.

## 8.7 Air-Cooled Exhaust of Large-Scale Systems

Three basic types of large-scale systems of *Legionella* disease with air washers, wetted media evaporative air coolers/humidifiers, or steam humidifiers. A representative recirculating device using water from a building tank was employed in one outbreak of *Legionnaires' Disease*. There is a documented case of *Legionnaires' Disease* that occurred in a hospital setting and resulted from aerosolized hot water from a humidifier (12).

## 8. INDIRECT EVAPORATIVE AIR COOLERS

Indirect evaporative air coolers cool air in a heat exchanger, which transfers heat to a secondary substance as shown in Figure 4. Although the primary air is cooled by the evaporative secondary air, no moisture is added to the primary air.

**8.1 System Description.** The heat exchanger is cooled by evaporation of water utilizing one of several methods:

1. direct wetting of the heat exchanger surface
2. cooling of secondary air utilizing evaporative cooling media
3. inserting spray into secondary airstream or onto heat exchanger surface
4. cooling tower and coil

Figure 4. Indirect evaporative cooling.

## 9.2 System Operation

9.2.1 Temperature. The restricted water temperature approximates the wet-bulb temperature of the secondary air stream. As in the case with direct evaporative air coolers, it is unlikely that the water temperature will exceed 25°C (77°F).

## 9.3 Water Disposal Size

Water disposal size will vary with exchanger type, condition of the media and media condition (when used), air velocity through the unit, and other factors. Refer to the section of this guideline regarding specific exchanger types, i.e., cooling towers, radiators, etc.

## 9.4 Restrictions

See 7.4 for equipment using a cooling tower to cool the secondary air stream and 8.4 for equipment using evaporative coolers or radiators to cool the secondary air stream.

## 9.5 Recommended Treatments

See 7.5 for equipment using a cooling tower to cool the secondary air stream and 8.5 for equipment using evaporative coolers or radiators to cool the secondary air stream.

## 9.6 Sizing

Indirect evaporative air coolers should not be located near the source of a cooling tower, fluid cooler, evaporative cooler, blower exhaust, paint booth, bathroom, or any other source of organic vapors.

## 9.7 Associated Costs

There has been no positive association of Legionnaires' disease with indirect evaporative air coolers.

## 10. METALWORKING SYSTEMS

### 10.1 System Description

In these systems, manufacturing fluids are applied in coating surfaces for lubrication and to prevent overworking of both the machine tool and the machined part.

### 10.2 System Operation

Both wet-based and water-based fluids are used. A variety of such fluids are commercially available from many companies.

As a rule, microbial growth does not occur in oil-based products. However, water-based fluids do become colonized by microorganisms.

10.2.1 Temperature. As the fluids cool the machine tool and machined part, they become heated and the ambient temperature of the fluid ranges from 24° and 32°C (75°F and 90°F), preventing the growth of many pathogens including *Legionella* species.

### 10.3 Water Disposal Size

These systems can produce discharges of varying rates depending on the specific machining operation and have the potential to produce discharges that may be microbially rich.

### 10.4 Treatments

These systems are typically open and subject to contamination from the air and surfaces that are being machined.

## 10.5 Associated Cases of Legionnaires' Disease

Metalworking systems have been implicated in the outbreak of Pontiac fever as well as acute respiratory syndrome and hypersensitivity pneumonitis.<sup>14</sup>

### 10.6 Recommended Treatments

Exposure from metalworking operations can be a serious potential health concern, the magnitude of which is not fully understood. Fluids are supplied with fluid concentrations, which are diluted when used and/or added to the fluid reservoir. However, the variety of fluids, microbial types, concentrations, and metal operators makes it difficult to design and evaluate predictable. Selection of fluids should be based on fluid and operator health needs.

It is recommended that care be taken to minimize contamination and to reduce exposure to machine operators until better information is available.

### 11. MACHINING FOR LEGIONELLOSIS

Calculating for Legionnaires' may be appropriate if carried out for a specific purpose, such as verifying the effectiveness of a water treatment process, tracing the source of an outbreak, evaluating the potential for transmission procedures have been facility, verifying that the transmission procedures have been effective, or to health care facilities serving for patients with extremely high risk of developing Legionnaires' disease (e.g., organ transplant recipients) etc. Where relevant to personnel, proper sampling, handling, and shipping methods should be used.<sup>15</sup>

However, except as discussed in 5.6.1.2, routine culturing of samples from building water systems may not be predictive of the risk of contamination for the following reasons:

1. Presence of the organism cannot be directly related to the risk of infection. The organism is frequently present in water systems without being associated with known cases of disease.
2. Interpretation of the results of culturing of water is confounded by use of different microbiologic methods, in various laboratories, by different culture media, among sites sampled within a water system, and by fluctuations in the concentration of *Legionella* isolated from a single site.
3. The risk of illness following exposure to a given source is influenced by a number of factors other than the concentration of organisms in a sample. These factors include, but are not limited to, water volume, heat susceptibility, and how efficiently the organisms are aerosolized to the user's point of exposure to reach the deep portion of the human lung and remain viable.
4. Test results only represent the results as the time the sample was collected. A negative result from one sample is likely to lead to a false sense of security because any sample can quickly become heavily colonized if it is not replaced.

Testing is not a substitute for sound maintenance practices and water treatment.

POLICY STATEMENT REGARDING ASHRAE'S CONCERN  
FOR THE ENVIRONMENTAL IMPACT OF ITS ACTIVITIES

ASHRAE is concerned with the impact of its members' activities on both the urban and outdoor environment. ASHRAE's members will strive to minimize any possible deleterious effect on the urban and outdoor environment of the systems and components in their responsibility while maintaining the healthful effects upon the system, consistent with occupied standards and the practical sense of the act.

ASHRAE's strategy will be to ensure that the systems and components within its scope do not impose the urban and outdoor environment in a greater extent than expected by the standards and guidelines as established by both the user and the system.

As an energy goal, ASHRAE will, through its Standards Committee and existing technical committees, continue to generate up-to-date standards and guidelines which emphasize and accept, implement, and promote those new and revised standards developed by other responsible organizations.

Through its Standards, appropriate changes will consider up-to-date standards and design considerations as the material is applied to the field.

ASHRAE will take the lead with respect to dissemination of environmental information of its primary concern, and will seek out and disseminate information from other responsible organizations that is pertinent to plans to update standards and guidelines.

The effects of the design and selection of equipment and systems will be considered within the scope of the systems standards and associated methods. The impact of building materials, if any, will also be considered.

ASHRAE's primary concern for environmental impact will be of the type which occurs within ASHRAE's scope of interest. However, energy source selection and the possible environmental impact due to the energy source and energy transportation will be considered where possible. Recommendations concerning energy source selection should be made by the members.

		Policy Title: Water Supply Failure (Code W)	
Effective Date: 4/2015		Oversight Level: Level 2	Policy No: EG-105
Reviewed:			
Revised:			
McLaren Flint Business Unit: Engineering Department		Functional Responsibility for the Policy: Director of Engineering	

**Objective:** McLaren Flint Hospital campus will be able to prepare for, respond to, and recover from a total or partial interruption of McLaren Flint's normal water supply.

**Scope:** This policy applies to McLaren Flint Hospital, the adjacent outpatient sites and all immediate grounds.

**Policy:** A water supply failure can be categorized as one of multiple types of system disruptions:

1. Visibly Discolored Water
2. Water Boil Advisory
3. Scheduled Interruption of Water Supply
4. Emergency Loss of Water Supply

#### Visibly Discolored Water

Visibly discolored water can be defined when the appearance of potable water, specifically, is iron-tinted and or yellow in color. There are two major sources that can cause water to be discolored – flow changes in the municipal distribution system caused by a main leak, valve failure or an open fire hydrant, and/or a flow change to the internal water system of the building. Discolored water is not a health threat even though it is not very appealing to drink. Even very low levels of iron can color the water.

1. Engineering Services shall recommend the affected area run water continuously (or flush) for a minimum of five (5) minutes or until it clears of the discoloration. If water does not clear within five (5) minutes contact Engineering Services via a work order using AIMS, the Computerized Maintenance Management System (CMMS).
2. In the event that the five (5) minute flush is not successful, Engineering Services will investigate the cause of the discoloration, which may include contacting the City of Flint or appropriate municipality to determine if discoloration is externally caused.
3. Based on information gathered from the municipality or knowledge of the source, Engineering Services will determine if a Code W shall be announced.

#### Boil-Water Advisory

A boil-water advisory or boil-water order is a public health advisory or directive given by government or health authorities to consumers when a community's drinking water is, or could be, contaminated by pathogens.

1. Boil Advisory notification received from the City of Flint, Flint Township, Genesee County Health Department or another governmental agency, such as the EPA.

2. Engineering Services is to establish and maintain direct contact with the governmental agency to determine location/boundaries of the advisory, estimate the duration of the advisory and provide a status report.
3. Engineering Services shall direct a Code W to be announced over head, with duration and details, if known.
4. Communications will immediately begin notification of critical departments by direct phone call and shall document the contact. (see Attachment A)
5. The Incident Commander and/or Nursing Supervisor with Administration shall determine if the HIC (Hospital Incident Command) is needed for communication management purposes. If so a Code Triage alert shall be announced overhead and paged to all HIC.
6. Engineering Services will shut off the water source to ice machines and drinking fountains, following the Engineering Services Ice Machine policy. The remaining ice in the ice machines shall not be used for human consumption. The ice may be utilized within ice packs. Signs shall be posted indicating the inability to use these units.
7. Distribution of potable water and the appropriate dispensing apparatus to departments for drinking purposes and hand-washing shall be conducted by Engineering Services.
8. Departmental-specific procedures including alternate hand washing protocols are instituted.
9. The sanitary sewer system (toilets, urinals and drains) may still be used.
10. All affected departments shall enact departmental-specific water conservation procedures. If deemed necessary, Engineering Services shall enact the "Extreme Conservation Procedures" of the Disaster Internal/External Engineering policy.

#### Scheduled Interruption of Water Supply

A scheduled interruption of water supply includes a total loss or reduced volume of the municipal water supply. The loss may be internally created or by a municipality. Prior notice will be given to all areas affected.

1. All attempts will be made to provide a minimum of 48 hour notice to the affected areas or buildings.
2. Engineering Services is to establish and maintain direct contact with the governmental agency to determine the area affected and estimate the duration of the interruption and provide status reports as necessary.
3. Administration and Engineering shall determine if the HIC (Hospital Incident Command) is necessary for communication management. If so the HCC will be set up ahead of the scheduled interruption.
4. Distribution of potable water and the appropriate dispensing apparatus to departments for drinking purposes and hand-washing shall be conducted by Engineering Services.
5. Engineering services will contact the bottled water supplier to increase the bottled potable water supply and dispensing apparatus available for drinking use and hand washing prior to the interruption to maintain a minimum of fifty (50) 5-gallon bottles at the hospital during the water interruption.

6. Engineering Services will shut off the water source to ice machines and drinking fountains, following the Engineering Services Ice Machine policy. The remaining ice in the ice machines may be dispensed and used. Signs shall be posted indicating the inability to use these units once the ice has been completely dispensed.
7. All affected departments shall enact departmental-specific water conservation procedures. If deemed necessary, Engineering Services shall enact the "Extreme Conservation Procedures" of the Disaster Internal/External Engineering policy.
8. If water shut down duration is anticipated to be greater than four (4) hours, Engineering Services will contract to provide portable sanitary toilets for staff and visitor use.
9. The sanitary sewer system (toilets, urinals and drains) may not be used.
10. Code W shall be announced overhead with duration and details.
11. Engineering Services shall update a Code W status report every hour to staff via an overhead page.
12. Engineering Services shall contact the State of Michigan Fire Marshal.
13. Engineering Services will institute a fire watch for affected areas.
14. In the event of a prolonged interruption or unforeseen emergency Administration shall initiate a code triage alert.

#### Emergency Loss of Water Supply

An emergency loss of water supply includes a total loss or reduced municipal water supply, with no prior notice. The loss may be internally created or by a municipality.

1. Engineering Services is to establish and maintain direct contact with the governmental agency to determine the area affected and estimate the duration of the interruption and provide status reports as necessary.
2. Engineering Services shall contact the State of Michigan Fire Marshal.
3. Engineering Services will institute a fire watch for affected areas.
4. All affected departments shall enact the departmental-specific water conservation procedures. If deemed necessary, Engineering Services shall enact the "Extreme Conservation Procedures" of the Disaster Internal/External Engineering policy.
5. Administration and Engineering shall determine if the HIC (Hospital Incident Command) is necessary for communication management. If so a code triage alert will be announced.
6. Code W shall be announced overhead with duration and details.
7. Engineering Services shall update a Code W status report every hour to staff via an overhead page.
8. Communications will immediately begin notification of critical departments by direct phone call and shall document the contact. (see Attachment A)
9. All affected departments shall enact the departmental-specific water conservation procedures. If deemed necessary, Engineering Services shall enact the "Extreme

Condition Conservation" procedures of the Disaster Internal/External Engineering policy.

10. Distribution of potable water and the appropriate dispensing apparatus to departments for drinking purposes and hand-washing shall be conducted by Engineering Services.
11. Engineering services will contact the bottled water supplier to supplement the potable water supply and dispensing apparatus available for drinking use to maintain a minimum of fifty (50) 5-gallon bottles at the hospital.
12. Engineering Services will shut off the water source to ice machines and drinking fountains, following the Engineering Services Ice Machine policy. The remaining ice in the ice machines may be dispensed and used. Signs shall be posted indicating the inability to use these units once the ice has been completely dispensed.
13. If water shut down duration is anticipated to be greater than four (4) hours, Engineering Services will contract to provide portable sanitary toilets for staff and visitor use.
14. The sanitary sewer system (toilets, urinals and drains) may not be used.

**Definitions:**

Boil-water advisory : a public health advisory or directive given by government or health authorities to consumers when a community's drinking water is, or could be, contaminated by pathogens

Code W: a water supply failure/interruption

Emergency loss of water supply: a total loss or reduced municipal water supply, with no prior notice. The loss may be internally created or by a municipality.

Fire Watch: a person or persons assigned to an area for the purpose of protecting the occupants from fire or similar emergencies. (NFPA 101, *Life Safety Code*, §3.3.77, 2000 edition)

Municipal Water: water originating from a ground or surface water source (raw water) which is purified through a treatment process, stored and distributed using a distribution system network of pumping stations and underground piping to the user.

Potable water: water suitable for drinking and hand washing.

Scheduled interruption of water supply: a total loss or reduced municipal water supply. The loss may be internally created or by a municipality. Prior notice will be given to all areas affected.

Visibly discolored water: when the appearance of potable water, specifically, is iron-tinted and/or yellow in color. There are two major sources that can cause water to be discolored -- flow changes in the municipal distribution system caused by a main leak, valve failure or an open fire hydrant, and/or a flow change to the internal water system of the building. Discolored water is not a health threat even though it is not very appealing to drink. Even very low levels of iron can color the water.

**Provisions:**

The City of Flint provides municipal water and monitors the quality of water provided to McLaren Flint Hospital, Ballenger MRI, Surgery and Endoscopy Center, McLaren Imaging Center, Barbara Ann Karmanos-McLaren Flint Cancer Center and Proton Beam.

Flint Township provides municipal water to Medical Education, Beech Hill Centre, McLaren

Corporate Offices, McLaren Health Plan, and the McLaren Hospitality House.

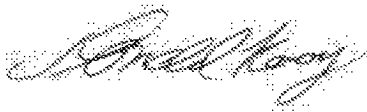

250 gallons of potable water are stored on site and stock is checked periodically.

**Administrative Responsibility:** McLaren Flint Director of Engineering has overall administrative responsibility for this policy.

**Exception Provisions:** McLaren Flint Incident Commander, State of Michigan Fire Marshal, McLaren Flint Director of Engineering, Vice President of Ancillary and Support Services and/or Chief Executive Officer may supersede any or all of the above noted directives with expressed written documentation.

**References or Appendices:** Extreme Condition Conservation procedures, Disaster Internal/External policy

	<b>Policy Title: Water Management Including Legionella Prevention</b>	
<b>Effective Date:</b> 2/01 <b>Review Dates:</b> 12/16 <b>Revised:</b> 12/04, 4/07, 11/10, 5/14, 12/14	<b>Oversight Level:</b> Level 2	<b>Policy No:</b> EG-101
<b>McLaren Flint Business Unit:</b> Engineering	<b>Functional Responsibility for the Policy:</b> Engineering Department	

**Objective:** To ensure safe water management for McLaren Flint

**Scope:** All departments, units, clinics and facilities under the direction of McLaren Flint

**Definitions:** McLaren Flint shall provide a potable water supply for drinking, food preparation, hand washing, and personal hygiene for patients, visitors, and employees.

- Provisions:**
- A. When potable (drinking) water is not available, a potable supply will be furnished. Engineering shall establish sources for potable water per policy and arrange for supplies in times of water interruption (See Engineering Procedure Manual).
  - B. If there is a break in the water system to the facility, the municipal water supplier is responsible for testing the water. As a precaution, a copy of the city's report shall be obtained and reviewed by engineering to confirm results.
  - C. If there is a potential internal or external contamination of the water system within the facility and the need for testing is evident, water samples shall be collected by a third-party consultant and sent to a licensed laboratory for analysis.
  - D. All construction areas with new plumbing fixtures shall have water samples collected by a third-party consultant and sent to a licensed laboratory for analysis prior to use.
  - E. If a disruption of service is planned or occurs spontaneously, Engineering shall notify Infection Control and the managers of the affected area, establish a potable water source, and conduct water testing if required. The Infection Preventionist, along with area managers, shall notify and educate staff, patients, and visitors as to the source and use of the temporary potable water supply.
  - F. Only potable water can be used for drinking, food preparation, handwashing, and personal hygiene. In the event of a water shortage or disruption in service, an alcohol-based hand rinse may be used temporarily until access to a potable water source has been established. Alcohol-based hand rinses shall not replace hand washing on a permanent basis.
  - G. Anti-siphon valves shall be installed on faucets used for dialysis to prevent backflow and contamination during use.

- H. Incoming potable water contains chlorine for continued disinfecting. McLaren Flint may inject additional chlorine to reduce or remove microbe colonization within the water system. Chlorine levels are checked twice per week to assure levels are adequate for prevention of Legionella growth (1-2 mg/L while remaining within standards of the Environmental Protection Agency.) These records are maintained by Engineering Services and are made available to the Infection Control Coordinator upon request.
- I. Environmental Services shall flush all showers and faucets of all plumbing fixtures at the time of routine cleaning. Faucets shall be wiped with a disinfectant during the daily cleaning. Aerators containing sediment that has compromised the output and cannot be properly cleaned shall be reported to Engineering for service.
- J. Cooling tower water management shall be treated for microbial growth using approved chemical disinfectants. Treatment schedules shall be dictated by the type of disinfectant and recommended concentration. Cooling tower maintenance and treatment records shall be maintained by Engineering. Testing, treatment, and documentation shall be maintained by Engineering.
- K. Water system shall be flushed with chlorine or monochloramine on at a minimum of twice a year basis. During system flushing bottled water and coolers of ice shall be made available to floors for patient and staff use. (See the Engineering Procedure Manual for a detailed reference to the hyperchlorination process.)
- L. Water management issues shall be reported to the Environment of Care Committee quarterly. In case of abnormal events or trends, the Infection Control Coordinator shall be consulted for recommendation.

**Administrative  
Responsibility:**

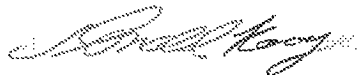

Infection Control, Engineering Services

# Update on Genesee County Legionellosis cases — May-Nov, 2015

## Current Case Count

- 42 cases reported since 5/1/2015 (41 Legionnaires disease, 1 Pontiac Fever)
- 38/42 (90%) interviewed with supplemental questionnaire
- Illness onset dates: 5/4/15-10/29/15

2015 calendar by month

by cases that are still being investigated

- 22 (52%) male; median age 67 years (range 35–89 years)
- 42 patients were hospitalized; 2 deaths ← Case of death?

## Case Counts by Hospital

Hospital Admissions

Hospital	Number of cases diagnosed	Previously-admitted**		Case Residence on City of Flint Water**
		To any hospital	To case hospital	
A	5	0	0	3
B	26	19*	18	6
C	8	0	0	0
Out of county	2	1**	0	1
<b>Total</b>	<b>41</b>	<b>20</b>	<b>18</b>	<b>10</b>

\*Hospitalization within the two weeks prior to Legionellosis illness onset

\*\*Based on Legionella Questionnaire answers and patients address

\*One case DX'd at Hospital B spent significant time at Hospital A during the 2 weeks prior, but was not admitted

\*\* This case was previously admitted to Hospital B

Suzanne  
Hospital B timeline  
Talking Points/Timeline

### Lab Results

- 42 (100%) were Legionella Urinary Antigen positive
- To date, 11 respiratory specimens have been received at the MDHHS Bureau of Labs for culture/typing
  - 8 were culture confirmed; all *L. pneumophila* Serogroup 1
    - 3 specimens unsuitable for PFGE: 2 no growth, 1 specimen overgrown with mold
    - 8 specimens were able to have PFGE performed

-6/8 specimens had unique patterns:

Onset date	Hospitalization within 2 weeks prior to onset?	Residence on City of Flint water?
7/7/15	No	No
7/16/15	No	No
7/23/15	No	No
8/28/15	No	No
9/1/15	No	Yes
9/10/15	No	No

-2/8 specimens had matching patterns:

Onset date	Hospitalizations within 2 weeks prior to onset?	Residence on City of Flint water?
5/27/15	Yes- Hospital B	No
8/15/15	No	No

### Exposure History

- Cases with hospitalization during the 2 weeks prior to onset: 21\*/42 (50%)
  - 20/21 (95%) were hospitalized at Hospital B in the 2 weeks prior to their onset
    - The last case with a hospitalization exposure to Hospital B during the 2 weeks prior to onset occurred the beginning of September; last date of hospitalization: 9/1/15, onset: ~9/10/15
  - \*1/21 (5%) was not hospitalized, but spent significant time at Hospital A during the 2 weeks prior to onset
- 21/42 (50%) cases have no prior hospitalization reported during the 2 weeks prior to onset
- 32/42 (76%) case residences NOT on the City of Flint water system
- 10/42 (23%) case residences on the City of Flint water system
  - 6/10 (60%) cases with residence on the City of Flint water system also had a hospitalization at Hospital B during the 2 weeks prior to onset

NORS - is it complete?  
Get it finalized and submit.

MDHHS Preliminary Data on Genesee County Legionellosis Investigation (April 29, 2015)  
Epi Info Analysis of Questionnaire Data

30 cases of 46 have been interviewed so far (65% interviewed). Of these interviews, 29 are complete and 1 interview was refused half way through (97% completed, 63% of all cases).

(exposure period)

3.) Where did you get your tap (drinking and other household use) water from \_\_\_/\_\_\_/\_\_\_ to \_\_\_/\_\_\_/\_\_\_?

## Genesee Legionnaires' Disease Outbreak Investigation Interview Data Analysis Plan

### 1. Cleaning

- ✓ Check address and City of Flint Water (COFW) status
  - i. Check the one non-COFW to COFW water (purple tabs on Water map)
- ✓ Check hospitalization during exposure period?
- ✓ Create variables: Inpatient Y/N, Outpatient Y/N, Visited Y/N and check if the hospital exposure occurred during the exposure period / Any HealthCare Exp. Y/N

### 2. Add comorbidity and symptom data from MR/MDSS to EpiInfo

#### ✓ Stratify by healthcare, COFW

- ✓ Basic analysis of interview data
- ✓ Stratify Q4-7 by Tap Water Source

### 3. Community Exposures Analysis

- ✓ Stratify Community exposures by COFW Y/N
- ✓ Stratify Community exposures by hospital visit status Y/N
- ✓ Map Community Exposures of 9 non-hospital/non-CoFW exposure with interviews

### 4. M- Healthcare exposure analysis

- ✓ Stratify by LoS
- ✓ Stratify by CoF water
- ✓ Stratify by smoking status

### 5. L- Comorbidity analysis

- ✓ General
- ✓ Of hospitalized patients
  - a. Unknown exposures

### 6. 12 non-healthcare, non-flint

- ✓ Check resident address
- ✓ Mapping (see 2c)

Based on Medical Records:

45 Cases

→ 25 people had some exposure to a hospital (inpatient, outpatient, or visitor)

1. 18 hospitalized (inpatient) within exposure period (XX did not)
  - a. 16 McLaren: 8 on CoFW, 8 not on CoFW
  - b. 2 Hurley: 1 on CoFW, 1 not on CoFW
2. 5\* outpatient visits within exposure period (41 did not, 0 unknown)
  - a. 5 McLaren: 3 on COFW, 2 not on COFW
  - b. One also had an inpatient visit to McLaren (NOT on COFW)
3. 4\* visited someone in the hospital (17 did not, 23 were unknown)
  - a. 1 visited McLaren and Hurley (NOT on COFW)
  - b. 2 McLaren (1 on COFW, also had inpatient at McLaren, 1 not COFW)
  - c. 1 Hurley (on COFW)

→ 20 people with no exposure to hospital based on Medical Records

4. 8 on COFW
5. 12 not on COFW

→ 12 people not on CoFW with no hospital exposure

6. 9 interviewed
7. 3 lost to follow-up

Based on

ClearCorp	6/4/2015	yes	discussed with Colin		7/2/2015	no
Gazze/MIT	6/3/2015	yes	discussed with Colin		7/2/2015	no

(I sent email asking for changes, also suggesting wait for Kaplowitz/Larder work. Kit left phone message, I sent email explaining the project.

8/3/15 still waiting for LG to send MIT IRB

8/25/15 made a few edits and sent DUA w/attachment to Colin, and sent IRB review app to MDHHS-IRB

11/6 asked Heather/Sue about waiver approval

Nudge Colin when you get IRB response.

request was withdrawn

Data sent waiting for Waiver document, then will send all to IRB 1/4/16 waiting for Waiver document, then will send all to IRB

Moody & Grady, MSU	6/23/2015	yes	approved, data sent	Approved	12/30/2015	no
Tanaka/Tufts	8/5/2015	yes	submitted to Colin		8/27/2015	no
McElmurry, WSU	9/8/2015	yes	returned to McElmurry		9/9/2015	no
Teach	9/7/2015	yes				
Hanna-Arthia, Hurley	9/22/2015	yes	Approved green light from Colin	Approved	10/2/2015	no
Pizarro-Zadell			Approved green light from Colin		12/30/2015	
CEH		yes	Approved green light from Colin		1/6/2016	

I signed DUA and submitted to work, to be linked system

2/11 Submitted all docs to IRB. Also sent DUA to Pizarro for signature

2/11 Replied to Shins inquiry, stating I thought we were waiting for Tish IRB approval. I don't have a Tish IRB approval

① WCHD - sent DUA - Colin feedback, data sent

- F-9. Too few children in Michigan are screened for lead through routine blood tests as recommended for children ages 1 and 2. Statewide screening goals for children enrolled in Medicaid are met in very few instances at the county level or within Medicaid health plans. This lack of information leaves parents, healthcare professionals, and local and state public health authorities uninformed about the possibility of lead poisoning for thousands of Michigan children.
- F-10. Coordination between MDEQ and MDHHS was inadequate to properly address the public health issues related to water quality in Flint. Communication was infrequent, and when it did occur, the default position was to conclude that the health problems were not related to the water supply switch—rather than to assume that the problems might be related to the switch.
- F-11. Communication and coordination among local and state public health staff and leadership regarding Legionellosis cases in 2014-2015 was inadequate to address the grave nature of this outbreak. The fact that these cases occurred *while* there were several simultaneous concerns about quality and safety of water in Flint should have caused public health staff and leadership at local and state levels to coordinate their actions to ensure a prompt and thorough investigation.

### *Recommendations*

- R-6. Establish policies and procedures at MDEQ and MDHHS to ensure input by health experts and scientists when permit decisions may have a direct impact on human health.
- R-7. Establish and maintain a Flint Toxic Exposure Registry to include all the children and adults residing in Flint from April 2014 to present.

The Flint Toxic Exposure Registry will serve as an authoritative reference source of information (including contact details [for example, primary contact information, back-up contact information, and preferred mode of contact]) for purposes of timely health assessments in the short-term and long-term, as well as subsequent communication regarding policies and scientific findings. Timely assessments will include clinical evaluations and re-evaluations in healthcare settings, appropriate follow-up conducted by public health professionals, and longitudinal assessments of the impact of environmental exposure on children's and adults' health (including among pregnant women).

- R-8. Re-establish the Michigan Childhood Lead Poisoning Prevention and Control Commission.

The Commission would perform a comprehensive review of the state's lead poisoning prevention program; evaluate the effectiveness of the program, including its ability to satisfy federal law requiring that 100 percent of all young children enrolled in Medicaid be screened with a blood lead test; and make recommendations for the program's improvement. The Commission would also conduct public hearings, review information from other sources, and study other states' experiences. The Commission must also develop short- and long-range strategic recommendations for childhood lead poisoning prevention and control in Michigan.

- R-9. Ensure that MDHHS is transparent and timely in reporting and analysis of aggregate data regarding children's blood lead levels. MDHHS data regarding lead levels shall be provided

to individuals and organizations, based on their expertise, upon request and in cases when the interpretation of data by MDHHS is questioned.

R-10. Establish a more aggressive approach to timely clinical and public health follow-up for all children known to have elevated blood lead levels, statewide. MDHHS should expand its local efforts and partnerships to accomplish this goal. Whenever possible, routine screening for lead and appropriate follow-up should occur in children's primary care medical homes.

R-11. Strive to be a national leader in monitoring and responding to exposure of children to lead by converting the Childhood Lead Poisoning Prevention Program (CLPPP) from passive collection of test results into an active surveillance and outreach program.

Performance of the surveillance program should be reported to the public. MDHHS should be prepared to amplify its efforts if performance targets are not met.

R-12. Improve screening rates for lead among young children through partnerships with county health departments, health insurers, hospitals, and healthcare professionals.

R-13. As the state authority on public health, and as the organization that conducted the epidemiologic study of Legionellosis cases in Genesee County in 2014-15, take responsibility for coordinating with GCHD and CDC to protect Michigan residents from further outbreaks of Legionellosis.<sup>43</sup>

R-14. In cases of switches in drinking water supplies in the future, the state must assume that outbreaks of cases of Legionellosis may be related to changes in water source and should communicate the potential risk to the public, rather than assuming and communicating the opposite.

## Michigan Governor's Office

### *Defined Role*

The Governor of Michigan heads the executive branch of Michigan state government and has the power to reorganize state departments and appoint department heads. All executive branch departments of state government report to the Governor, including the three key departments involved in the Flint water crisis: MDEQ, MDHHS, and Treasury. The Governor also appoints personal staff to keep him informed of issues and events. Among other responsibilities, the Governor (through the Michigan Department of Technology, Management and Budget) submits an annual budget and has a line-item veto for appropriations bills.

Rick Snyder, Michigan's 48th Governor, took office in January 2011. He began his second term in January 2015.

---

<sup>43</sup> Specific steps should include: (a) anticipate the risks of Legionellosis infections going forward; (b) take timely steps to minimize those risks in Flint drinking water by working with EPA, MDEQ and Flint WTP; (c) coordinate with healthcare facilities to minimize risks of healthcare facility-acquired Legionellosis; (d) communicate with the public about steps being taken and cases of Legionellosis that occur.

To: [TO BE DETERMINED]  
From: [TO BE DETERMINED]  
Date: [TO BE DETERMINED]  
Subject: Leveraging Health Information Technology to Respond to the Flint Crisis

#### Purpose of the Memo

The contamination of Flint's drinking water with lead has created a major public health crisis throughout the city. As part of the State of Michigan's response to the crisis, MDHHS is improving the reporting and monitoring of blood lead testing results and expanding Medicaid coverage to affected residents. The use of health information technology (HIT) will be critical for achieving both of these goals, and MDHHS will leverage the statewide health information exchange infrastructure and Transformed Medicaid Statistical Information System (T-MSIS) as part of this effort. This memo outlines the current status of HIT in Michigan and identifies a strategy for expanding HIT solutions to respond to the crisis.

#### Current Status of Electronic Reporting for Blood Lead Analysis Results

Timely reporting of blood lead analysis results is a crucial component of combatting childhood lead exposure in Michigan. The State of Michigan and federal government have taken action to ensure that lead exposure is effectively identified and reported. Clinical laboratories are required under Michigan law to electronically report blood lead analysis results to MDHHS. State and federal policies require children to be tested for lead exposure if they receive services through the Medicaid program or Women, Infant, and Child nutrition program. Finally, MDHHS incentivizes Medicaid Health Plans to test enrolled children for lead exposure: MDHHS has included a Lead Screening in Children metric as part of performance measurement for the health plans, and the Department also incorporated the metric into the performance bonus program and automatic assignment algorithms. These policies have improved blood lead testing rates of Medicaid-enrolled children and reporting of blood lead analysis results to MDHHS.

The Childhood Lead Poisoning Prevention Program (CLPPP) within MDHHS is the statewide program that collects and uses testing results in order to guide public health efforts. Laboratories may submit testing results to CLPPP through one of three methods, which are described in further detail below. Please also refer to Figure 1, which highlights key pieces of infrastructure that support electronic reporting of test results.

- Method #1: A laboratory may submit testing results through the secure File Transfer application or the Data Exchange Gateway. (The vast majority of laboratories use this method currently.) This method usually involves editing of each laboratory's submission so that the file conforms to the structure of the surveillance database. It also involves the use of test files or Excel files, which must be manually uploaded by MDHHS staff into the Michigan Childhood Lead Poisoning Surveillance System (MCLPSS).
- Method #2: A laboratory may submit test results through the Michigan Health Information Network (MIHIN). For this method, a laboratory sends the test results message through the laboratory's Health Information Exchange, and the Health Information Exchange passes the message to the MIHIN. MIHIN forwards the message to the MDHHS Data Hub, which processes the message content and sends relevant information to the Michigan Disease Surveillance System (MDSS) and MCLPSS.

Deleted: two  
Commented [SM1]: I find this description of the three methods very confusing. Are you describing how labs report electronically now, or how they would report under the new scenario. I think you need to have the first section describe how electronic lab reports come in now and get uploaded to the surveillance database, and then describe how it would work in the new system described in the flow chart below.

rewrite present / future  
HL7 project

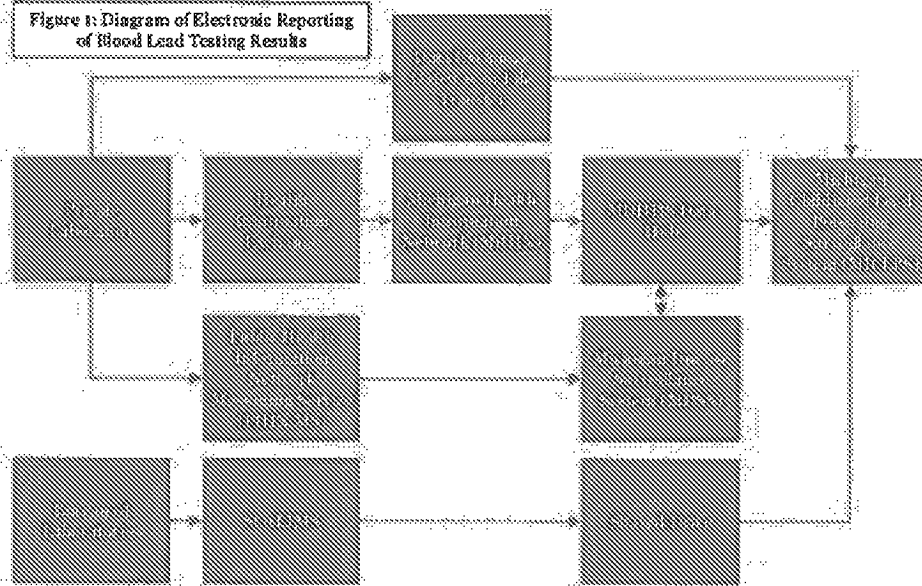

DRAFT

CONFIDENTIAL

NOT FOR PUBLIC DISTRIBUTION

- Method #3: A laboratory may submit test results through the Public Health Information Network Messaging Service (PHIN MS). Some Private laboratories primarily use this method of reporting. For this method, the laboratory would submit the test results to the federal Public Health Information Network Messaging Service (PHIN MS), and PHIN MS would then forwards the results to MOSS. MOSS then sends the message to the MDHHS Data Hub, which would process the message and send relevant information to the MICLPS.

Figure 1: Diagram of Electronic Reporting of Blood Lead Testing Results

The Bureau of Laboratories within MDHHS also conducts testing for blood lead. The Bureau of Laboratories currently posts a file with new testing results to a secure shared drive, and CLPPP staff retrieve the file and upload the information into the MICLPS system. Please refer to Figure 1 for additional information.

Once the testing results are uploaded into MICLPS, CLPPP makes the data available in various ways with community partners who provide services to children with lead exposure. Local Health Departments are able to log into the Healthy Homes and Lead Poisoning Surveillance System (HHLPS) to access case information for local children with lead exposure. CLPPP also sends Blood Lead Extract Files with Medicaid data and surveillance data to the Medicaid Health Plans, who can identify children who have not been tested yet and make arrangements for testing and follow-up services.

#### Current Status of the Management of Medicaid Information through T-MSIS

The Michigan Medicaid program provides essential support for preventing and treating lead exposure amongst children. The T-MSIS system facilitates the delivery of Medicaid-funded services such as

Deleted: provider

Commented [SM(3)]: I don't think this is right, either. My understanding is that PHIN MS isn't a data repository which data goes in and out of, it is software that CDC makes available to states to use for "exchanging data securely over the internet and facilitating interoperability among myriad public health information systems." See <http://www.cdc.gov/phinf/tools/phinms/index.html>

testing, treatment, and follow-up care for lead exposure. T-MSIS collects and organizes data on eligibility, enrollment, program, utilization, and expenditure data for Medicaid and Children's Health Insurance Program services. This information is used to coordinate the delivery of services, improve the management of the Michigan Medicaid program, and meet reporting requirements from the Centers for Medicare and Medicaid Services (CMS). MDHHS also uses T-MSIS to compile a weekly Blood Lead Extract of Medicaid data and surveillance data, which is sent to the Medicaid Health Plans. The Medicaid Health Plans use this information to coordinate services for children who have suffered from lead exposure.

On March 3<sup>rd</sup>, 2016, CMS approved a new 1115 demonstration authority to extend Medicaid coverage to Flint residents impacted by the lead exposure. Under the new 1115 authority, 15,000 additional children and pregnant women will become eligible for Medicaid coverage, and 30,000 current Medicaid beneficiaries in Flint will be eligible for expanded services. The T-MSIS system will play a key role in implementing this expansion through (1) managing eligibility, enrollment, and coverage information and (2) enabling longitudinal tracking and provision of follow-up services for affected residents.

#### Strategy for Leveraging HIT to Respond to the Flint Crisis

MDHHS will build upon current policies and HIT solutions in order to effectively respond to the Flint crisis. This strategy outlines actions, investments, and partnerships that MDHHS will pursue as part of the public health response.

##### o Connecting Providers to HIT

HIT can improve the capacity of providers to test children for lead exposure, coordinate services for affected residents, and report crucial public health information to MDHHS. MDHHS will promote the adoption and use of HIT in Flint through the following strategies.

MDHHS operates a Medicaid Electronic Health Record Incentive Program to assist Medicaid providers with adopting and using HIT. CMS also operates a similar Incentive program for Medicare providers. According to federal data, 611 providers in Genesee County are participating in the Medicaid program and/or Medicare program: this figure includes 426 Medicare providers, 182 Medicaid providers, and 3 Dual Eligible Hospitals. MDHHS determined that 34 additional providers may be eligible to participate in the Medicaid program. MDHHS will conduct outreach to these providers and assist them with enrollment and participation in the program. MDHHS will also explore opportunities under the recent State Medicaid Director letter to use Medicaid funding to facilitate electronic public health reporting.

CMS has also purchased point-of-care blood lead analysis devices to deploy at clinics in Flint. These devices allow clinics to complete blood lead testing analysis without having to send results to the laboratory. These portable devices are considered laboratories, and clinics and offices that use them are required to report under the same rules as CLIA certified laboratories. MDHHS will collaborate with providers, CMS, and the Office of the National Coordinator for Health Information Technology on integrating these devices into public health reporting efforts.

Deleted:

Deleted: new

Finally, Great Lakes Health Connect (GLHC) is partnering with the Greater Flint Health Coalition to improve information sharing and service coordination for affected residents. This partnership will allow providers and community service organizations to access GLHC's virtual health record platform. MDHHS will explore opportunities to partner with GLHC and other stakeholders on using GLHC's platform to improve the delivery of services to residents.

## o Improving the Reporting and Sharing of Blood Lead Analysis Results

Laboratories can submit testing results to MDHHS through MDSS. The Flint crisis highlighted the need to improve participation rates in MDSS. Some local health departments have also expressed interest in directly receiving testing results from MDHHS instead of having to log into HHLPSS. MDHHS will work with the Michigan Health Information Network (MIHIN), Health Information Exchanges, providers, and local health departments to expand participation and explore opportunities to send testing results directly to local health departments.

Deleted: Providers

Deleted: the

Deleted: Electronic Reportable Labs Use Case

Deleted: provider

Deleted: the use case.

## o Enhancing Information Management and Service Coordination within MDHHS

MDHHS will upgrade its contracts and information technology systems to support the response to the Flint crisis. On January 1, 2016, MDHHS revised its contracts with Medicaid Health Plans to require the development of care management programs for children with Elevated Blood Lead Levels. MDHHS will also integrate ~~data~~ identifiers into the Transformed Medicaid Statistical Information System (T-MSIS) to enable longitudinal tracking and provision of follow-up services for affected residents in Flint.

## Challenges and Potential Solutions for Improving the Use of HIT

In order to fully implement the strategy, MDHHS and its partners must confront two potential challenges, which are outlined below.

### o Lack of Interoperability for the Blood Lead Analysis Testing Devices

The first challenge is addressing the limited functionality of the blood lead analysis devices that CMS has purchased. The current models on the market can only be connected to printers and cannot be integrated with an Electronic Health Record (EHR) system. While these devices will allow the clinics to conduct testing, the clinics must manually enter the results into their EHRs and prepare a separate spreadsheet to send to MDHHS. This duplicative process discourages participation of clinics in electronic reporting. MDHHS will work with providers, Health Information Exchanges, and MIHIN to explore opportunities for optimizing EHRs in order to enable direct electronic reporting to MDHHS.

### o Lack of Participation by Private Laboratories in the MDHHS Electronic Reportable Labs Use Case

The second challenge is overcoming the barriers to participation by laboratories in MDSS. Many providers use laboratories to conduct blood lead analysis tests. Most laboratories send testing results to MDHHS through "flat files" (Method #1) or PHR M5 (Method #3) instead of MDSS (Method #2). MDHHS would like to encourage laboratories to migrate towards participation in MDSS. However, this migration would require laboratories to reconfigure their HIT systems to send HL7 messages as opposed to flat files or PHR M5 messages. Due to the potential costs and labor hours involved in this process, most laboratories have chosen to keep their legacy processes. To address this issue, MDHHS will explore opportunities under the recent State Medicaid Director letter to facilitate the participation of laboratories in the use case.

## Conclusion

DRAFT

CONFIDENTIAL

NOT FOR PUBLIC DISTRIBUTION

MDHHS is working to respond to the Flint lead crisis through a series of strategic actions, investments, and partnerships. HIT will play an essential role in this effort through supporting improvements in public health reporting and facilitating the expansion of Medicaid coverage and services to affected residents. MDHHS will also be required to address challenges with using HIT such as the limitations of Blood Lead Analysis Testing Devices and lack of participation in the MDHHS Electronic Reportable Labs Use Case. However, MDHHS can work to overcome these issues by pursuing the aforementioned strategy and building partnerships with key stakeholders.

To: [TO BE DETERMINED]  
 From: [TO BE DETERMINED]  
 Date: [TO BE DETERMINED]  
 Subject: Leveraging Health Information Technology to Respond to the Flint Crisis

#### Purpose of the Memo

The contamination of Flint's drinking water with lead has created a major public health crisis throughout the city. As part of the State of Michigan's response to the crisis, MDHHS is improving the reporting and monitoring of blood lead testing results and expanding Medicaid coverage to affected residents. The use of health information technology (HIT) will be critical for achieving both of these goals, and MDHHS will leverage the statewide health information exchange infrastructure and Transformed Medicaid Statistical Information System (T-MSIS) as part of this effort. This memo outlines the current status of HIT in Michigan and identifies a strategy for expanding HIT solutions to respond to the crisis.

#### Current Status of Electronic Reporting for Blood Lead Analysis Results

Timely reporting of blood lead analysis results is a crucial component of combatting childhood lead exposure in Michigan. The State of Michigan and federal government have taken action to ensure that lead exposure is effectively identified and reported. Clinical laboratories are required under Michigan law to electronically report blood lead analysis results to MDHHS. State and federal policies also require children to be tested for lead exposure if they receive services through the Medicaid program or Women, Infant, and Child nutrition program. Finally, MDHHS incentivizes Medicaid Health Plans to test enrolled children for lead exposure: MDHHS has included a Lead Screening in Children metric as part of performance measurement for the health plans, and the Department also incorporated the metric into the performance bonus program and automatic assignment algorithms. These policies have improved the reporting rates for blood lead analysis results in Michigan.

The Childhood Lead Poisoning Prevention Program (CLPPP) is the statewide program that collects and uses testing results in order to guide public health efforts. Laboratories may submit testing results to CLPPP through one of three methods, which are described in further detail below. Please also refer to Figure 1, which highlights key pieces of infrastructure that support electronic reporting of test results.

- o Method #1: A laboratory may submit testing results through the secure File Transfer application or the Data Exchange Gateway. The vast majority of laboratories use this method. This method also involves the use of test files or Excel files, which must be manually input by MDHHS staff into the Michigan Childhood Lead Poisoning Surveillance System (MCLPSS).
- o Method #2: A laboratory may submit test results through the Michigan Health Information Network (MIHIN). This method is known as the MDSS Electronic Reportable Labs Use Case. For this use case, a laboratory sends the test results message through the laboratory's Health Information Exchange, and the Health Information Exchange passes the message to the MIHIN. MIHIN forwards the message to the MDHHS Data Hub, which processes the message content and sends relevant information to the Michigan Disease Surveillance System (MDSS) and MCLPSS.
- o Method #3: A laboratory may submit test results through the Public Health Information Network Messaging Service (PHIN MS). Some laboratories use this method of reporting. For this method, the laboratory would submit the test results to the federal Public Health Information Network.

Deleted: primarily

Deleted: provider

Messaging Service (PHIN MS), and PHIN MS would then forward the results to MDSS. MDSS would then send the message to the MDHHS Data Hub, which would process the message and send relevant information to the MICLPS.

The Bureau of Laboratories within MDHHS also conducts testing for blood lead. The Bureau of Laboratories currently posts a file with new testing results to a shared drive, and CLPPP staff retrieve the file and input the information into the MICLPS system. Please refer to Figure 1 for additional information.

Deleted: sends the test results message to the MDHHS Data Hub, which processes the message and sends relevant information to MICLPS.

Once the testing results are collected by MDHHS, the Department shares this information with several community partners who provide services to children with lead exposure. Local Health Departments are able to log into the Healthy Homes and Lead Poisoning Surveillance System (HHLPPSS) to access case information for local children with lead exposure. MDHHS also sends Blood Lead Extract Files with Medicaid data and surveillance data to the Medicaid Health Plans, who can identify children who have not been tested yet and make arrangements for testing and follow-up services.

Deleted: provide

Deleted: to enrollees who have been exposed to lead

#### Current Status of the Management of Medicaid Information through T-MSIS

The Michigan Medicaid program provides essential support for preventing and treating lead exposure amongst children. The T-MSIS system facilitates the delivery of Medicaid-funded services such as testing, treatment, and follow-up care for lead exposure. T-MSIS collects and organizes data on eligibility, enrollment, program, utilization, and expenditure data for Medicaid and Children's Health Insurance Program services. This information is used to coordinate the delivery of services, improve the

management of the Michigan Medicaid program, and meet reporting requirements from the Centers for Medicare and Medicaid Services (CMS). MDHHS also uses T-MSIS to compile a weekly Blood Lead Extract of Medicaid data and surveillance data, which is sent to the Medicaid Health Plans. The Medicaid Health Plans use this information to coordinate services for children who have suffered from lead exposure.

On March 3<sup>rd</sup>, 2016, CMS approved a new 1115 demonstration authority to extend Medicaid coverage to Flint residents impacted by the lead exposure. Under the new 1115 authority, 15,000 additional children and pregnant women will become eligible for Medicaid coverage, and 30,000 current Medicaid beneficiaries in Flint will be eligible for expanded services. The T-MSIS system will play a key role in implementing this expansion through (1) managing eligibility, enrollment, and coverage information and (2) enabling longitudinal tracking and provision of follow-up services for affected residents.

#### Strategy for Leveraging HIT to Respond to the Flint Crisis

MDHHS will build upon current policies and HIT solutions in order to effectively respond to the Flint crisis. This strategy outlines actions, investments, and partnerships that MDHHS will pursue as part of the public health response.

##### o Connecting Providers to HIT

HIT can improve the capacity of providers to test children for lead exposure, coordinate services for affected residents, and report crucial public health information to MDHHS. MDHHS will promote the adoption and use of HIT in Flint through the following strategies.

MDHHS operates a Medicaid Electronic Health Record Incentive Program to assist Medicaid providers with adopting and using HIT. CMS also operates a similar incentive program for Medicare providers. According to federal data, 511 providers in Genesee County are participating in the Medicaid program and/or Medicare program: this figure includes 426 Medicare providers, 182 Medicaid providers, and 3 Dual Eligible Hospitals. MDHHS determined that 34 additional providers may be eligible to participate in the Medicaid program. MDHHS will conduct outreach to these providers and assist them with enrollment and participation in the program. MDHHS will also explore opportunities under the recent State Medicaid Director letter to use Medicaid funding to facilitate electronic public health reporting.

CMS has also purchased point-of care blood lead analysis devices to deploy at clinics in Flint. These devices allow clinics to complete blood lead testing analysis without having to send results to the laboratory. MDHHS will collaborate with providers, CMS, and the Office of the National Coordinator for Health Information Technology on integrating these new devices into public health reporting efforts.

Finally, Great Lakes Health Connect (GLHC) is partnering with the Greater Flint Health Coalition to improve information sharing and service coordination for affected residents. This partnership will allow providers and community service organizations to access GLHC's virtual health record platform. MDHHS will explore opportunities to partner with GLHC and other stakeholders on using GLHC's platform to improve the delivery of services to residents.

##### o Improving the Reporting and Sharing of Blood Lead Analysis Results

Laboratories can submit testing results to MDHHS through the MDSS Electronic Reportable Labs Use Case. The Flint crisis highlighted the need to improve participation rates in the use case. Some local

health departments have also expressed interest in directly receiving testing results from MDHHS instead of having to log into HHLPS5. MDHHS will work with the Michigan Health Information Network (MIHIN), Health Information Exchanges, providers, and local health departments to expand participation and explore opportunities to send testing results directly to local health departments.

#### o Enhancing Information Management and Service Coordination within MDHHS

MDHHS will upgrade its contracts and information technology systems to support the response to the Flint crisis. On January 1, 2016, MDHHS revised its contracts with Medicaid Health Plan to require the development of care management programs for children with Elevated Blood Lead Levels. MDHHS will also integrate identifiers into the Transformed Medicaid Statistical Information System (T-MSIS) to enable longitudinal tracking and provision of follow-up services for affected residents.

### Challenges and Potential Solutions for Improving the Use of HIT

In order to fully implement the strategy, MDHHS and its partners must confront two potential challenges, which are outlined below.

#### o Lack of Interoperability for the Blood Lead Analysis Testing Devices

The first challenge is addressing the limited functionality of the blood lead analysis devices that CMS has purchased. The current models on the market can only be connected to printers and cannot be integrated with an Electronic Health Record (EHR) system. While these devices will allow the clinics to conduct testing, the clinics must manually enter the results into their EHRs and prepare a separate spreadsheet to send to MDHHS. This duplicative process discourages participation of clinics in electronic reporting. MDHHS will work with providers, Health Information Exchanges, and MIHIN to explore opportunities for optimizing EHRs in order to enable direct electronic reporting to MDHHS.

#### o Lack of Participation by Private Laboratories in the MDHHS Electronic Reportable Labs Use Case

The second challenge is overcoming the barriers to participation by laboratories in the MDHHS Electronic Reportable Labs Use Case. Many providers use laboratories to conduct blood lead analysis tests. Most laboratories send testing results to MDHHS through "flat files" (Method #1) or PHIN MS (Method #3) instead of the use case (Method #2). MDHHS would like to encourage laboratories to migrate towards participation in the use case. However, this migration would require laboratories to reconfigure their HIT systems to send HL7 messages as opposed to flat files or PHIN MS messages. Due to the potential costs and labor hours involved in this process, most laboratories have chosen to keep their legacy processes. To address this issue, MDHHS will explore opportunities under the recent State Medicaid Director letter to facilitate the participation of laboratories in the use case.

### Conclusion

MDHHS is working to respond to the Flint lead crisis through a series of strategic actions, investments, and partnerships. HIT will play an essential role in this effort through supporting improvements in public health reporting and facilitating the expansion of Medicaid coverage and services to affected residents. MDHHS will also be required to address challenges with using HIT such as the limitations of Blood Lead Analysis Testing Devices and lack of participation in the MDHHS Electronic Reportable Labs Use Case.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions, both incoming and outgoing. It emphasizes that this practice is essential for ensuring transparency and accountability in financial management.

2. The second section outlines the various methods used to collect and analyze data. This includes conducting surveys, interviews, and focus groups to gather insights from different stakeholders. The goal is to identify trends and patterns that can inform decision-making.

3. The third part of the document addresses the challenges faced during the implementation phase. These include limited resources, lack of buy-in from key personnel, and potential resistance to change. Strategies are provided to overcome these obstacles and ensure successful execution.

4. Finally, the document concludes by highlighting the long-term benefits of the proposed initiative. By implementing the outlined strategies, the organization aims to improve operational efficiency, enhance customer satisfaction, and ultimately achieve its strategic goals.

CDC update (5 minutes):

log in to ON S CLK  
C. J. H. 11/11  
with a 11/11

Flint: has gained national attention, has increased attention to lead poisoning in general statewide. Has also gained attention of our administration, resulting in a tremendous increase in internal demand for lead data—on Flint especially, and more recently other areas of the state—but also an increase in our program's staff—two new analysts and an epidemiologist soon.

Not directly related to Flint:

MICLPS – replacing old Lotus Approach database software with a new .Net system—still troubleshooting, trying to get from Test to Production

HHLPS – in Production, but always trying to move forward—main thing now is trying to improve reporting. If anyone out there has had success using Microsoft SQL Server Report Builder to create new reports, please let me know.

HL7 and HIE – creating <sup>state standard</sup> new HL7 message for blood lead; creating a pathway for labs to report HL7s through Michigan's HIE, landing automatically in MICLPS.

Trying to develop a detailed but efficient log of all data requests, whether routine (summary, de-identified) or complex (identified info requiring data use agreements and IRB approval).

Re: Leadline  
sys read spreadsheet  
L. J. H. 11/11

855-644-0229

3672483 #

1.) What is currently being done to assist children, in Flint, who have been exposed to lead?

a.) Ages 0 -6 years

Children with blood lead levels (BLL)  $\Rightarrow$  5 ug/dL are offered case management (nursing visits to the home for education and assessment, and coordination with the primary care provider), an environmental investigation by a State-certified investigator (to identify lead hazards), and enrollment in the Lead Safe Home Program (to remediate lead hazards that were identified).

b.) Ages 6-14 years

Same as above

c.) How many children in these age groups are actually being affected by elevated blood lead levels and the current means for assistance?

Since 4/1/2014 (approximately the time when Flint's water source was switched), 201 children age 0-5 and 25 children age 6 to 17 have been identified with BLLs  $\Rightarrow$  5 ug/dL.

2.) What is currently being done to prevent more children from lead exposure?

Distribution and installation of water filters, bottled water, nutrition education, [other??]

3.) Is there consistent blood lead testing currently ongoing in Flint? For what ages?

Typically all children enrolled in Medicaid or WIC, or having some other risk factor, should be tested at age 1 and 2. The CDC has called for all children in Flint age 0-5 to be tested by spring of 2016. Between April 1, 2014 and March 25, 2016, 7115 children in Flint less than six have been tested.

a.) Who pays for this testing and approximately how much does it cost?

Medicaid pays for the test for children who are enrolled. Some private insurances also pay for a test, otherwise it is self-pay. [or are all children tested for free at health department?] Many blood lead testing events have been held in the city, with sponsors picking up the tab for testing.

Medicaid pays \$xx for drawing the blood and \$xx for the analysis. Some private laboratories charge more for the analysis, but we don't know the specific prices.

4.) There are other low-income cities around the country who also show elevated blood lead levels, especially in children. Some even with higher levels than Flint. What can Flint learn from other cities where the children have higher blood lead levels?

[I don't have an answer for this.] *We are looking at this issue.*

a.) Have there been any known evidence based practices that have worked well in other areas with high lead exposures?

1. Removal of lead hazards, especially lead paint and dust in the home, and soil outside the home.

2. Education of families on the dangers of lead.

3. [other??]

GCHD  
added

12.8.15 – CM Status call with Sherry, Kim, Andrew, Jim?, Nancy, Karen.

**GCHD Info about challenges/barriers with CM in Flint:**

- CM staff have another 6 scheduled, not seen yet.
  - Some families with multiple kids, but GCHD has been counting the family, not # of children. So numbers look low.
    - *Follow up: Genesee staff will discuss with their Supervisor including count of children (in columns F and H), not count of families. Both parties understand that the # of Medicaid claims filed will not match the # of children.*
  - Many of these are old tests – so families are choosing to get a new test, want to see what those results are before they have someone come out.
  - Some families have moved, are not at the same address as when the child had the EBL, therefore do not want someone to come out.
  - Some people have asked for more information, so they can think about whether they want someone to come out.
  - Some people live with other people, so need to loop others into the decision to accept CM or invite the EBL investigator into the home.
  - Currently offering both CM and EBL when they call; some families don't want a 6 hour visit. Also the nurses are trying to go out with the EBL investigator, which holds up the CM visits.
    - *Follow up: Are we comfortable with the two services being offered separately, in case the family will accept one but not the other? We will review this here with Wes and Courtney; Genesee will review this with Jori to get her input.*
- ( ! )
- Some families are convinced that the water is the only problem, so they are not feeling the need for CM and/or EBL investigation that looks at the house. Some have accepted filters, but not CM/EBL.
  - Some children have a history of even higher EBLs, so a 5 or even a 10 now is not a big concern to the family.

Update on **PHI** Legionellosis cases —May-Oct, 2015

## Current Case Count

- 41 cases reported since 5/1/2015 (40 Legionnaires disease, 1 Pontiac Fever)
- 37/41 (90%) interviewed with supplemental questionnaire
- Onset dates: **PHI**

- 21 (51%) male; median age 66 years (range 35–89 years)
- 41 patients were hospitalized; 2 deaths

## Lab Results

- 41 (100%) were Legionella Urinary Antigen positive
  - 11 respiratory specimens received at BOL for culture/typing
    - 8 were culture confirmed; all *L. pneumophila* SG1
    - 3 specimens unsuitable for PFGE: 2 no growth, 1 specimen overgrown with mold
    - 8 specimens were able to have PFGE performed
- 6/8 specimens had unique patterns:

Onset date	Hospitalization within 2 weeks prior to onset?	Residence on City of Flint water?
<b>PHI</b>	No	No
	No	No
	No	No
	No	No
	No	Yes
	No	No

October 22, 2015

2/8 specimens had matching patterns:

Onset date	Hospitalizations within 2 weeks prior to onset?	Residence on City of Flint water?
PHI	Yes- McLaren	No
	No	No

#### Exposure History

- Cases with hospitalization during the 2 weeks prior to onset: 20\*/41 (49%)
  - 19/20 (95%) were hospitalized at McLaren in the 2 weeks prior to their onset
    - The last case with a hospitalization exposure to McLaren during the 2 weeks prior to onset occurred mid-August; last date of hospitalization: **PHI**
  - \*1/20 (5%) was not hospitalized, but spent significant time at Hurley during the 2 weeks prior to onset
- 21/41 (51%) of cases have no prior hospitalization reported during their incubation period
- Outpatient visits and visitations to hospitals have not been assessed
- 30/41 (73%) case residences NOT on City of Flint water system
- 10/41 (27%) case residences on City of Flint water system
  - 6/10 cases (60%) with residence on City of Flint water system also had a hospitalization at McLaren during the 2 weeks prior to onset

#### Actions McLaren Flint has taken/is taking (per GCHD)

- Hospital has been testing monthly at various locations since Fall of 2014
- McLaren is now working with a consultant, The Legionella Experts, Special Pathogens Lab, headed up by Dr Janet Stout, University of Pittsburgh, Swanson School of Engineering
- Hospital has been hyperchlorinating since last fall, but recently switched to monochloramine
- Upgrades have been made to the infrastructure (details unknown)
- McLaren is preemptively treating symptomatic patients who have been previously hospitalized in 2-week period prior to onset
- Staff receiving additional education about Legionella
- Using bottled water
- Monitoring water temperatures
- Communication is now with Risk Management team

- continuing monthly test

- test results

- one test result were different

- using bottled water

- testing prev consultant grp did, different

Oct 14 hyperchlorination, monitoring monthly

- aug 15 hyperchlorination

Mark Edwards - doing additional testing / performed last week

switch prev. consult grp maybe 20 June/15?

## EXECUTIVE SUMMARY

Environmental Protection Agency (EPA) and Michigan Department of Environmental Quality (MDEQ) regulations require that public water suppliers test drinking water quarterly throughout the distribution system for disinfectant by-products (DBP's). Two categories of DBP's, tri-halomethanes (THM) and halo-acetic acids (HAA5), are regulated and must be tested for. The City of Flint began operation of their water treatment plant (WTP) full time with the Flint River as the source on April 25, 2014. Since that time, two quarters of samples taken indicate that future violations are inevitable for total THM without some modifications to the water system. In response, the City hired Lockwood, Andrews & Newnam, Inc. (LAN) to complete this Operational Evaluation Report (OER) in conformance with EPA guidelines with the goal to determine the cause(s) of high levels of THM and evaluate possible solutions.

The EPA promulgated the Stage 2 Disinfectants and Disinfection By-Products Rule (DBPR) in January 2006 which set maximum contaminant levels (MCLs) for total trihalomethanes (TTHM) and HAA5 based on an annual running average, tested quarterly, for a given sampling location. The City of Flint reports levels from 8 sampling test locations. Of the two quarterly sampling cycles since Flint began operating the WTP full time, HAA5 levels have been acceptable but TTHM levels have been high at all 8 sampling sites.

According to the Stage 2 DBPR, the annual average value requires 3 quarters of sampling data with the most current period counting twice. Therefore, the City of Flint has not yet experienced a violation of the TTHM MCL because only 2 quarters of data have been obtained. However, levels recorded indicate the likelihood of an MCL exceedance later this year.

A number of issues have been identified as possibly contributing to the high THM levels measured.

1. Inefficient ozone system operation which has resulted in increased chlorine feed.
2. Sewer leak discovered upstream of intake causing high total Coliform levels, increased chlorine demand, and resulting need to increase chlorine feed.
3. Bypass stream around softening contributed to chlorine demand.
4. Unlined cast iron pipes in the distribution system contributing to chlorine demand.
5. Recirculating water in the distribution system due to less than ideal configuration of Cedar Street and West Side pump stations.
6. Broken valves resulting in stagnant water in some areas.
7. High chlorine demand in filters.
8. High THM formation potential (THMFP) in source water.
9. Less than optimal removal of THM precursors.

## ACTION PLAN

The City of Flint has signed an agreement with the Karegnondi Water Authority (KWA) to purchase raw water drawn from Lake Huron. The KWA system is currently under construction and expected to be operational by late 2016. The water supply from Lake Huron will have entirely different water quality characteristics from the Flint River and those characteristics are expected to yield drastically reduced DPB formation. With that, non-structural options to help reduce THM levels are much preferred over solutions requiring new construction. Therefore, two categories of actions have been devised: Stage 1 being actions that can be completed relatively quickly without major construction and Stage 2 consisting of either long term actions or solutions requiring major construction. The City has completed or intends to complete Stage 1 Actions by February 16, 2015, the week in which the next

quarterly sampling is to be done. Stage 2 actions are to be implemented only if Stage 1 actions are ineffective in adequately reducing TTHM levels and therefore Stage 2 is contingent upon the outcome of Stage 1.

#### *Stage 1 – Immediate Actions*

- Hire ozone system manufacturer to troubleshoot ozone system
- Bench scale jar testing
  - Match existing process and assess possible areas of improvement
  - Simulate potential modifications to treatment process
  - Evaluate coagulation and flocculation polymer aid feeds to assist with TOC removal
- WTP operational changes
  - Discontinue softening bypass stream to reduce chlorine demand
  - Disinfection of filter beds to reduce chlorine demand
  - Possibly begin coagulation and flocculation polymer aid feeds to assist with TOC removal depending on bench scale test results
- Increase water main flushing efforts to minimize stagnant water
- Water system modeling to identify areas with high water age and potential solutions
  - Cedar Street Pump Station potential recirculation
  - West Side Pump Station potential recirculation
  - Storage tank volume use
  - Possible broken closed valve locations
  - Locations in need of flushing
  - Lower high water levels in storage tanks

#### *Stage 2 – Contingent Actions*

- Fix ozone system
- Start feeding coagulation and flocculation polymer aids to lower TOC, if not completed in Stage 1
- Convert to lime and soda ash softening
- Change disinfectant to chloramine or chlorine dioxide until KWA
- Install pre-oxidant feed at intake to optimize ozone disinfection
- Implement advanced treatment for THM precursor removal
- Increased main flushing based on water modeling results
- Continue valve replacements with water model assistance
- Emphasize cast iron pipes on water main replacement priority list

## **I. BACKGROUND**

The City of Detroit Water and Sewer Department (DWSD) has historically provided drinking water for the City of Flint and Genesee County. In the late 1990's growing concern regarding the reliability of the DWSD supply prompted the City of Flint to upgrade their existing water treatment plant (WTP). Those improvements, defined as Phase I, were completed in 2005 and were intended to allow the Flint WTP to operate, using the Flint River as the source, for an extended period of time in the event that supply from the DWSD was temporarily interrupted. Additionally, the Phase I improvements set the stage for Flint to break free from dependence on the DWSD supply and water charges over which they had no control.

### **A. WATER SUPPLY TRANSITION**

#### **1. Detroit Water and Sewer Department (DWSD)**

Until recently the Genesee County and Flint region had been provided drinking water by the DWSD. However, due to excessive cost increases and reliability issues with the DWSD system other options had to be explored.

#### **2. Karegnondi Water Authority (KWA)**

In 2010 the Karegnondi Water Authority (KWA) was formed for the purpose of developing a new water supply from Lake Huron to serve the region in lieu of the DWSD supply and the City of Flint elected to join. The KWA expects the new system which is currently being constructed to become operational in the fall of 2016.

#### **3. Flint River – Interim Period**

With a water supply agreement between Flint and the DWSD set to expire in early 2014 and the KWA system not expected to be operational until late 2016, the City of Flint decided to initiate operation of the existing WTP full time utilizing the Flint River as the interim water source. A variety of WTP improvements were necessary for the Flint plant to become a full time plant. For purposes of this report, Phase II improvements to the Flint WTP are improvements which have been made to allow the plant to operate full time with either the Flint River as the source or the KWA supply as the source.

## **II. TTHM PENDING VIOLATIONS**

The calculation for determining if the MCL has been violated for TTHM is:

$$(2 \times \text{current quarter value} + \text{previous 2 quarter values}) / 4$$

Flint has completed tests for 2 quarters and therefore has not violated an MCL limit to date. However, the third quarter of sample data is likely to provide MCL exceedances at all 8 sampling sites. Test results are tabulated below.

**TABLE 1 – 2014 DBP TEST RESULTS**

Sample Location	TTHM			HAA5		
	1 <sup>st</sup> Qrt 5/21/14	2 <sup>nd</sup> Qrt 8/21/14	3 <sup>rd</sup> Qrt	1 <sup>st</sup> Qrt 5/21/14	2 <sup>nd</sup> Qrt 8/21/14	3 <sup>rd</sup> Qrt
3719 Davison - McDonalds	162.4	145.3		64	43	
822 S. Dort Hwy - BP Gas Sta.	111.6	112.0		52	40	
3302 S. Dort Hwy - Liquor Palace	96.5	127.2		48	31	
3606 Corunna - Taco Bell	106.4	181.3		55	24	
2501 Flushing - Univ. Market	75.1	196.2		38	17	
3216 MLK - Salem Housing	82.2	112.4		41	25	
5018 Clio - Rite Aid	88.2	144.4		49	30	
6204 N. Saginaw - N. Flint Auto	79.2	118.3		50	37	

TTHM MCL = 80 ug/l

HAA5 MCL = 60 ug/l

### C. WATER TREATMENT PLANT RECENT IMPROVEMENTS & STATUS

#### 1. Phase I WTP Improvements

Since 1965, the Flint WTP has remained a secondary or backup supply system to the DWSD primary supply. Typically the secondary supply for a public water system is expected to be needed only during emergency situations and normally is designed for short term operation such as providing the average daily demand for a few days. Conversely, Phase I improvements were designed with the intent to upgrade the Flint WTP in order to allow for an extended short term period (6 weeks) because of the perceived high risk that the DWSD supply would fail and remain out of service for an extended duration. Regardless, the Flint WTP was still intended to serve as a standby plant and as such the Phase I improvements lacked redundancies that would be required for a primary supply WTP.

#### 2. Past Pilot Study & Testing

During design of the Phase I improvements a treatability study was completed by Alvord, Burdick & Howson, LLC (AB&H) in 2002. The Treatability Study evaluated the current treatment processes that are in place at the Flint WTP today with the Flint River as the source. The report recommended the following:

**TABLE 2 – 2002 WTP TREATMENT RECOMMENDATIONS**

Treatment	Purpose	Point of Application	Dosage (mg/l)
Sodium permanganate	Zebra mussel control	Intake	0.3
Ozone	Taste & odor removal, disinfection	Diffusor basin	1.5
Ferric chloride	Coagulation	Rapid mix	40
Coag aid polymer	Turbidity & TOC removal	Rapid mix	2.0
Floc aid polymer	Turbidity & TOC removal	Floc basin	0.05
Lime	Softening	Softening basin	175
Soda ash	Softening	Softening basin	52
Carbon dioxide	pH adjustment	Recarb basin	37
Media filters	Filtration	Na	Na
Chlorine	Disinfection	Filter effluent	1.0

Of the recommended items, zebra mussel control, coagulant and flocculation polymer aids, and soda ash feed have not been incorporated into the treatment process.

### 3. Phase II WTP Improvements for Full Time Operation

Phase II WTP improvements are those needed to convert the Flint WTP from a back-up supply to a primary supply plant. A number of improvements have already been constructed as they were necessary to operate full time, treating water from the Flint River. The improvements under the title of Phase II that have been completed or are nearly complete include upgrades to the lime sludge lagoon, the lime sludge lagoon decant and disposal system, decant pump station and force main, installation of mid-point chlorination before filtration, and upgrade of the electric feed sub-station.

Additional improvements to the Flint WTP that are to be completed to become part of the normal treatment process using water supplied by the KWA are:

- New oxygen and nitrogen storage facilities for the ozone system
- New coagulant feed system
- Electrical
  - Pump Station #4 upgrades
  - Plant 2 improvements
  - Filter press building feeder
  - SCADA and controls upgrades
  - Filter transfer pump station feeders
- Installation of the future raw water feed connection point for the KWA
- Pump replacements and VFD installation in the low and high service pump station
- Filter transfer pump station to Dort Reservoir
- Facility security improvements

## II. SOURCE WATER EVALUATION

### A. DATA ANALYSIS

Based on past data collected and the 2002 Treatability Study by AB&H, the Flint River water quality varies seasonally with higher hardness and alkalinity experienced in the winter. Higher magnesium concentrations are also experienced in the winter, adding difficulty to the settling process due to neutrally buoyant floc. General water quality average characteristics recorded for the 2002 Treatability Study as compared with average characteristics recorded this year are shown in Table 3 below.

TABLE 3 – FLINT RIVER WATER QUALITY CHARACTERISTICS						
Period	Turbidity NTU	TOC Mg/l	Alkalinity Mg/l	Hardness Mg/l as CaCO <sub>3</sub>	pH	Total Col. Count/day
2001 Apr–Oct	7.9	9.4	215	272	8.1	870-1230 (7300 max)
2014 May–Oct	8.3	10.3 5/22/14	207	252	8.2	1900-9000 (48,300 max)

Other than total Coliform, the Flint River characteristics do not appear to have changed significantly over the past 10+ years. Note that further investigation by City staff revealed a sewer leak upstream of the plant that likely was contributing to the total Coliform count.

### B. CONCLUSIONS

Considering the minor changes in Flint River water quality, much of the information contained in the 2002 Treatability Study by AB&H remains relevant today. Data from that report assumed to be consistent today include the following:

- Flint River is influenced by groundwater from a dolomitic aquifer
- Hardness varies seasonally with higher hardness and alkalinity in the winter
- Hardness, alkalinity, magnesium concentrations tend to be reduced by run-off
- Total THMFP is likely 380-440 micrograms per liter as measured between April 2001 and January 2002. The City intends to re-test the raw water to confirm the THMFP has not changed. Results are pending.

In development of the 2002 Treatability Study, processes were simulated which resulted in low THMFP. Therefore, information contained in that report will be used to assist with establishing a baseline jar testing procedure discussed further in Section III.

### III. TREATMENT PROCESS EVALUATION

#### A. EXISTING PROCESS DESCRIPTION

The existing WTP consists of an intake with screening from the Flint River, low lift pumping, ozonation, rapid mix, flocculation, settling, softening, recarbonation, filtration, storage and high service pumping. A process diagram is shown as Figure 1.

##### 1. Intake

A 72" diameter pipe draws water from the Flint River through 2 traveling screens to the low lift pump structure. No chemicals are currently fed for Zebra mussel control or pre-oxidation as recommended by the 2002 Treatability Study. Manual removal of zebra mussels proved to be more economical than installation of chemical feed equipment considering the short term need.

##### 2. Ozone

There are 2 ozone generators designed to provide adequate ozone for a WTP flow of up to 36 mgd. There are 3 ozone contact basins. The ozone generators were designed to produce 900 lbs/day at 10% concentration and up to 1300 lbs/day at 6% concentration each. Recent readings have indicated a production rate of approximately 700 lbs/day at 4% concentration. While serving the purposes of taste and odor control and disinfection, it is possible the current ozone feed might not be optimized to realize additional TOC removal benefits demonstrated by previous tests. Also, less than optimal ozonation has led to increased chlorine feed.

##### 3. Rapid Mix

East and West rapid mix chambers allow chemical feed prior to the flocculation basins. Each rapid mix chamber is equipped with a 5 hp mixer.

##### 4. Coagulation / Flocculation

The WTP contains two equally sized flocculation basins, east and west, and each basin provides tapered or gradually slowed mixing from inlet to outlet. There are fifteen 2 hp mixers for each basin with VFDs to control mixing speed. The 2002 Treatability Study recommended feeding both coagulation and flocculation polymer aids. Neither polymer aid is being used today because turbidity and TOC removals have been sufficient to meet regulatory requirements.

##### 5. Settling

Primary clarification takes place within 3 basins containing plate settlers. The settlers are operating as designed.

##### 6. Softening

Again, there are two basins for softening: east and west. Each basin is 120' in diameter and contains a solids contact softening unit. Each softening basin/unit has a design capacity of 18 mgd. Low lift pumping limitations, flow control to the basins, and fluctuating demands have made it difficult for WTP staff to stabilize the softening process. Softening is accomplished by feeding lime. The decision was made by the City not to feed soda ash in order to remove non-carbonate hardness because acceptable hardness levels could be achieved with lime feed only and softening is short term until Lake Huron water becomes available.

#### 7. Recarbonation

Recarbonation for pH adjustment is accomplished in east and west recarbonation basins between and to the north of the softening basins. Carbon dioxide storage and feed equipment is located west of the recarbonation basins.

#### 8. Filtration

Filtration is accomplished with 12 dual media filters, equally sized and designed to filter 3.0 mgd each. Media consists of 12" of sand and 18" of anthracite. The filters have been operated intermittently over the years due to the standby nature of the WTP and until recently, chlorine injection took place downstream of the filters. It is possible some microbial growth has developed in the filters.

#### 9. Disinfection

Limited disinfection is provided by ozonation, but the primary form of disinfection is chlorine fed prior to filtration and prior to finish water storage / high service pumping. The intermediate chlorine injection location was recently constructed under the Phase II, Segment 1 contract.

#### 10. Clear Well & Pumping

The pump building sits adjacent to a 3 MG clear well and contains both low and high service pumps.

### B. JAR TESTS / EXPERIMENTS

#### 1. Approach

There are several well practiced methods by which DBPs can be reduced. First, the disinfectant can be changed to an alternate that has a lower tendency to form DBPs. Second, additional treatment systems such as activated carbon or air stripping (depending on the nature of the precursors) can be added to remove DBP precursors. Lastly, the existing treatment processes can be optimized to remove as much DBP precursor as possible. Of these options, optimizing existing treatment processes is the only strategy that does not require the construction of new and expensive facilities. It is anticipated that Flint will be receiving Lake Huron water in approximately two years and this water will have a completely different chemistry from the Flint River. Major process changes instituted to address THM levels using Flint River water are likely to be unnecessary for Lake Huron water and may even be inappropriate. Therefore, those options which require addition of new treatment processes are undesirable at this time. In recognition of this upcoming change in water source, this study will concentrate on improving the existing processes, rather than adding new ones. New treatment processes will only be recommended if operational changes to the existing treatment train prove ineffective.

Recent sample test results suggest that most of the DBPs are formed in the distribution system rather than within the treatment plant. Therefore, the most logical approach is to reduce the DBP formation potential (DBFP) rather than simply lowering the levels of DBPs leaving the plant. During bench scale testing, formation potential (FP) levels will be the primary indicator of success or failure of any proposed process modifications.

#### 2. Protocol

Bench scale pilot testing is intended to reflect actual plant operating and hydraulic conditions so the bench scale treatment units will be sized based on various dimensionless factors to ensure the pilot treatment matches the actual system. Bench scale ozonation is not practical due to time and cost limitations. Therefore, water

samples will be withdrawn following the plant ozone basin. These samples will be transported to the laboratory where they will be dispensed into square testing jars. The jars will act as rapid mix, three-stage flocculation, and settling. Rapid mix and flocculation conditions will be matched to the plant based on "Gt" values. The "G" value is a measure of the mixing intensity and is a function of mix time, viscosity of the liquid, and mixing power applied to the water. "Gt" then, is a size scaling factor where time has been accounted for. Settling time will be scaled to match the shorter settling depth of the testing jars. After settling, samples will be decanted from the test jars. The decanted samples will then be lime softened; softening conditions will be similarly matched on the basis of "Gt". Fluoride will be added and carbon dioxide sparged into the samples to reduce the pH. The water will then be vacuum filtered through filter paper, sized to simulate the plant's dual media filters. The samples will be dosed with excess chlorine and allowed to react for seven days before testing for DBPs to determine the formation potential.

Although these conditions may be refined based on new information, we anticipate the following:

TABLE 4 – BENCH SCALE TEST MIXING INTENSITIES		
Process	G	Duration
Ozonation	Plant	
Rapid Mix	350	25 sec
Flocculation, Stage 1	50	9 min
Flocculation, Stage 1	25	9 min
Flocculation, Stage 1	12	9 min
Settling	na	10 min
Softening	TBD	10 min
Recarbonation	na	na

It is expected that the primary variables during the testing will be chemical additions and chemical dosages. Specific chemicals and dosages used for initial testing conditions will be selected to reflect current plant usage and the recommendations of the 2002 Treatability Study:

TABLE 5 – BENCH SCALE TEST CHEMICAL FEED RATES		
Chemical	Current Usage	2002 Study
Ozonation	4.66 mg/l	1.5 mg/l
Ferric Chloride	7.7 mg/l	40 mg/l
Coagulant Aid Polymer	Not used	2.0 mg/l
Flocculation Aid Polymer	Not used	0.05 mg/l
Lime	120 mg/l	175 mg/l
Soda Ash	Not used	52 mg/l
Cationic Softening Polymer	3.13 mg/l	Not used
Anionic Softening Polymer	0.88 mg/l	Not used
Fluoride	0.45 mg/l	1 mg/l
Carbon Dioxide	32 mg/l	37 mg/l
Chlorine	6.3 mg/l	1 mg/l

### **3. Considerations**

The 2002 Treatability Study did not note significant formation of DBPs. This may be a function of different Flint River water chemistry at that time. However, recognizing the considerable differences in chemical usage and dosages between that study and current operations, those differences in chemical use and dosage are an obvious starting point for optimizing treatment to prevent DBP limit exceedance.

Although it is believed that optimization of current treatment can correct the DBP issue, should optimization of present treatment prove insufficient, alternate residual disinfectants (chloramines and chlorine dioxide) will be investigated as additional treatment measures.

### **4. Results**

To be completed following jar testing and experimentation.

### **5. Conclusions**

To be completed following jar testing and experimentation.

DRAFT

#### IV. DISTRIBUTION SYSTEM EVALUATION

EPA guidance for the distribution evaluation portion of an OER is focused on identification and isolation of a specific portion of the distribution system that led to the exceedance. The circumstances of Flint's apparent pending TTHM exceedances are unusual in that a new supply has been implemented which clearly corresponds to the high TTHM sample results. Despite obvious implications to the primary cause of increased TTHM levels, value remains in evaluating the distribution system as there may still be distribution improvements that can be made to help alleviate the problem.

Evaluation of the distribution system, including modeling, was recently added to LAN's scope of services. When finished, information will be provided to complete the following topics in this section.

##### A. INFRASTRUCTURE

###### 1. Piping

Main break history information available?

List pipe data for system... age, material, size

###### 2. Storage

Considering drop off in demands in recent years, are storage tanks oversized?

Do they have mixing, baffling, other, to prevent stagnant water?

Are tanks in good condition?

###### 3. Pump Stations

Condition of pump stations?

Pumps oversized?

Are valves working properly to maintain pressure zones?

##### B. OPERATIONS AND MAINTENANCE

###### 1. Pump Station & Storage Operations

Are pressure districts set up properly?

Cedar Street Pump Station – no established pressure zone? Talk to Flint

West Side Pump Station – no established pressure zone? Talk to Flint

High and low levels in tanks optimally set? Should they be adjusted to use less storage volume?

###### 2. Booster Disinfection Practices

They don't have any, do they?

###### 3. Changes in System Demands

Long term decline in demands

Short term fluctuations – max day in winter due to large number of main breaks

## C. WATER SYSTEM HYDRAULIC MODELING

### 1. Simulation of Existing System

Match existing conditions, particularly chlorine residual. We have chlorine feed data at plant and residuals at 10 locations in each MOR, May-October.

### 2. Identification of Deficiencies

Specific issues to look at:

- Worst case at minimum daily demands
- Water age in entire system
- Recirculating water through pump stations
- Use of storage tanks
- Indications of broken valves

DRAFT

## V. RECOMMENDATIONS TO MINIMIZE FUTURE OEL EXCEEDANCES

### A. SOURCE

The City of Flint has already committed to the change from the Flint River as the water source to Lake Huron under the KWA system, planned for late 2016. The risk of future TTHM limit violations will decline substantially with the use of water from Lake Huron due to much lower DBP precursors. It is important to recognize that the Flint River will become strictly an emergency supply when the KWA supply becomes available and any investments toward the Flint River should be contemplated accordingly. Recommendations discussed below in this section apply to the Flint River as the source.

Reverting to supply from the DWSD until the KWA supply is available as an option. However, the DWSD has stipulated that a \$4 million connection fee would apply and current water rates would include approximately \$900,000 / month flat fee plus usage charges. Therefore, utilizing the DWSD for interim supply is cost prohibitive under the terms defined by the DWSD.

#### 1. Watershed Management

A volunteer group entitled the Watershed Coalition performs various tasks related to managing the Flint River watershed such as spring cleanups and annual benthic studies to evaluate the river 'health'. No additional action is recommended at this time.

#### 2. Monitoring

The City documents typical raw water characteristics as part of standard preparation of Monthly Operating Reports (MOR). No changes are recommended at this time.

#### 3. Intake Operations

The 2002 Treatability Study recommended pre-oxidation in the form of sodium permanganate as a feed at the intake. However, pre-oxidation with sodium permanganate is unlikely to provide significant oxidizing of organics beyond that provided by ozonation. It is possible the addition of hydrogen peroxide would enhance the ozone process.

#### 4. Seasonal Strategies

Past data indicates the Flint River is influenced by groundwater and in particular, dolomitic spring water. The result is hard water with high concentrations of magnesium and sulfate. Also, hardness and alkalinity are higher during the winter. Upon initiation of supply from the Flint River, the City made the decision to soften with lime only to focus on removal of carbonate hardness. One potential modification that could assist with TOC removal and thus decrease THMFP would be lime and soda ash softening. If implemented soon, the procedural change would be timely as it would also address increased hardness expected going into this winter.

#### 5. Upstream Contamination Issues

Upstream contamination issues are extremely difficult to prevent and even if detected are difficult to locate. Evaluation of raw water data collected for MORs is the easiest manner in which to detect upstream contamination issues because the data is already collected for treatment purposes. In fact, high total Coliform readings signaled a potential issue recently that the City found to be a sewer leak, which was subsequently repaired.

An upstream monitoring and warning system could be established to attempt to detect spill event type contamination early enough to cease intake prior to the contamination reaching the WTP. However, given the imminent conversion to the KWA supply, the period of full time use would likely be far too short to achieve payback on the capital expenditures.

## B. TREATMENT PROCESS

### 1. Operational Recommendations

- Coagulation and flocculation polymer aids: The 2002 Treatability Study suggested the use of coagulation and flocculation polymer aids. These polymer aids were shown in the 2002 Treatability Study to increase TOC removal and thereby reduce THMFP. Further evaluation will be completed during jar testing. [what would need to be done to the system to allow feed?? Could it be done easily??]
- Discontinue softening bypass: The City was previously bypassing a portion of flow around the softening basins because hardness levels did not warrant softening of the full stream. However, this practice was discontinued because it was believed the bypass stream was contributing to chlorine demand and preliminary data has supported that belief. Chlorine demand dropped 0.5 – 1.0 mg/l following elimination of the bypass stream in early November 2014.
- Soften with lime and soda ash: Research has shown that enhanced softening with both lime and soda ash may provide additional TOC removal. The efficacy of this option will be evaluated during jar testing.
- Disinfection of filter beds: In case there has been microbial growth it is recommended the filters be 'shock' treated with chlorine and rinsed. A chlorine injection point was added upstream of the filters during the first segment of Phase II so future growth in the filters should not be an issue.
- Optimization of all existing treatment processes: Depending on bench scale testing conditions and results, slight modifications to all treatment processes might in order to replicate lower DPBFP.

### 2. Infrastructure Change Recommendations

- Fix and/or replace faulty ozone equipment: Since the ozone equipment was installed it has not been used extensively so the hope is that major components remain in good condition and the system can be easily modified to restore proper functionality. The City has scheduled the equipment manufacturer to field inspect the system on December 15, 2014.
- Change disinfectant to chloramine or chlorine dioxide: If other options prove to be ineffective, conversion to another disinfectant should be fully evaluated. Various characteristics of chloramination indicate an advantage over chlorine dioxide, but a full analysis would provide clarity as to which would be preferred.
- Install pre-oxidant chemical feed: Hydrogen peroxide as a pre-oxidant can enhance the activity of the ozone. This option is listed as a consideration only if problems continue with ozonation.
- Repair upstream sewer leak: a sewer leak upstream of the WTP intake was discovered and has already been repaired by the City.

### C. DISTRIBUTION SYSTEM

Recommendations will be incorporated into this report when available. It is anticipated details will be provided for the following topics.

1. Manage Water Age
  - a) Storage Tanks
  - b) Residence Time in Pipes
2. Reduce Disinfectant Demand
  - a) Flushing
  - b) Cast Iron Pipes
3. Water Modeling of Recommendations
  - Determine best flushing locations to reduce water age
  - Changes to storage tank operating levels to reduce water age
  - Valves to close/add to improve pressure zones, reduce recirculation
  - Optimization of pump station use — smaller pumps? Shut down?

A number of actions have already been taken in terms of the distribution system. Water main flushing efforts were increased until late November when freezing weather became prevalent. Also, numerous valves that were broken in the closed position and believed to have been contributing to stagnant water were replaced.

### D. BOOSTER DISINFECTION

Decreasing chlorine feed at the WTP and adding booster disinfection in the distribution system is an alternative intended to reduce the reaction time at higher concentrations of chlorine to reduce DPB formation. Extensive looping and branching within the existing system would require numerous booster feed points and water system modeling to determine the most effective feed point locations. As a result, booster disinfection would likely not be cost effective. Further discussion and details will be provided when the distribution evaluation results are available.

### E. CATEGORIZATION OF ACTIONS

Considering that the Flint River is being used as the water source only until the KWA supply is available (expected late 2016), options to address high THM formation that require new construction or extensive time to implement are not preferred. On the other hand, the City understands THM sample results to date dictate that some action is necessary. Two categories have been developed to assist the City in prioritizing actions to take. Stage 1 consists of actions that can be completed relatively quickly without major construction and Stage 2 actions are either long term actions or solutions requiring major construction. Stage 1 actions are to be completed first followed by evaluation of the results prior to consideration of Stage 2 actions. Grouping of actions are shown in the table below.

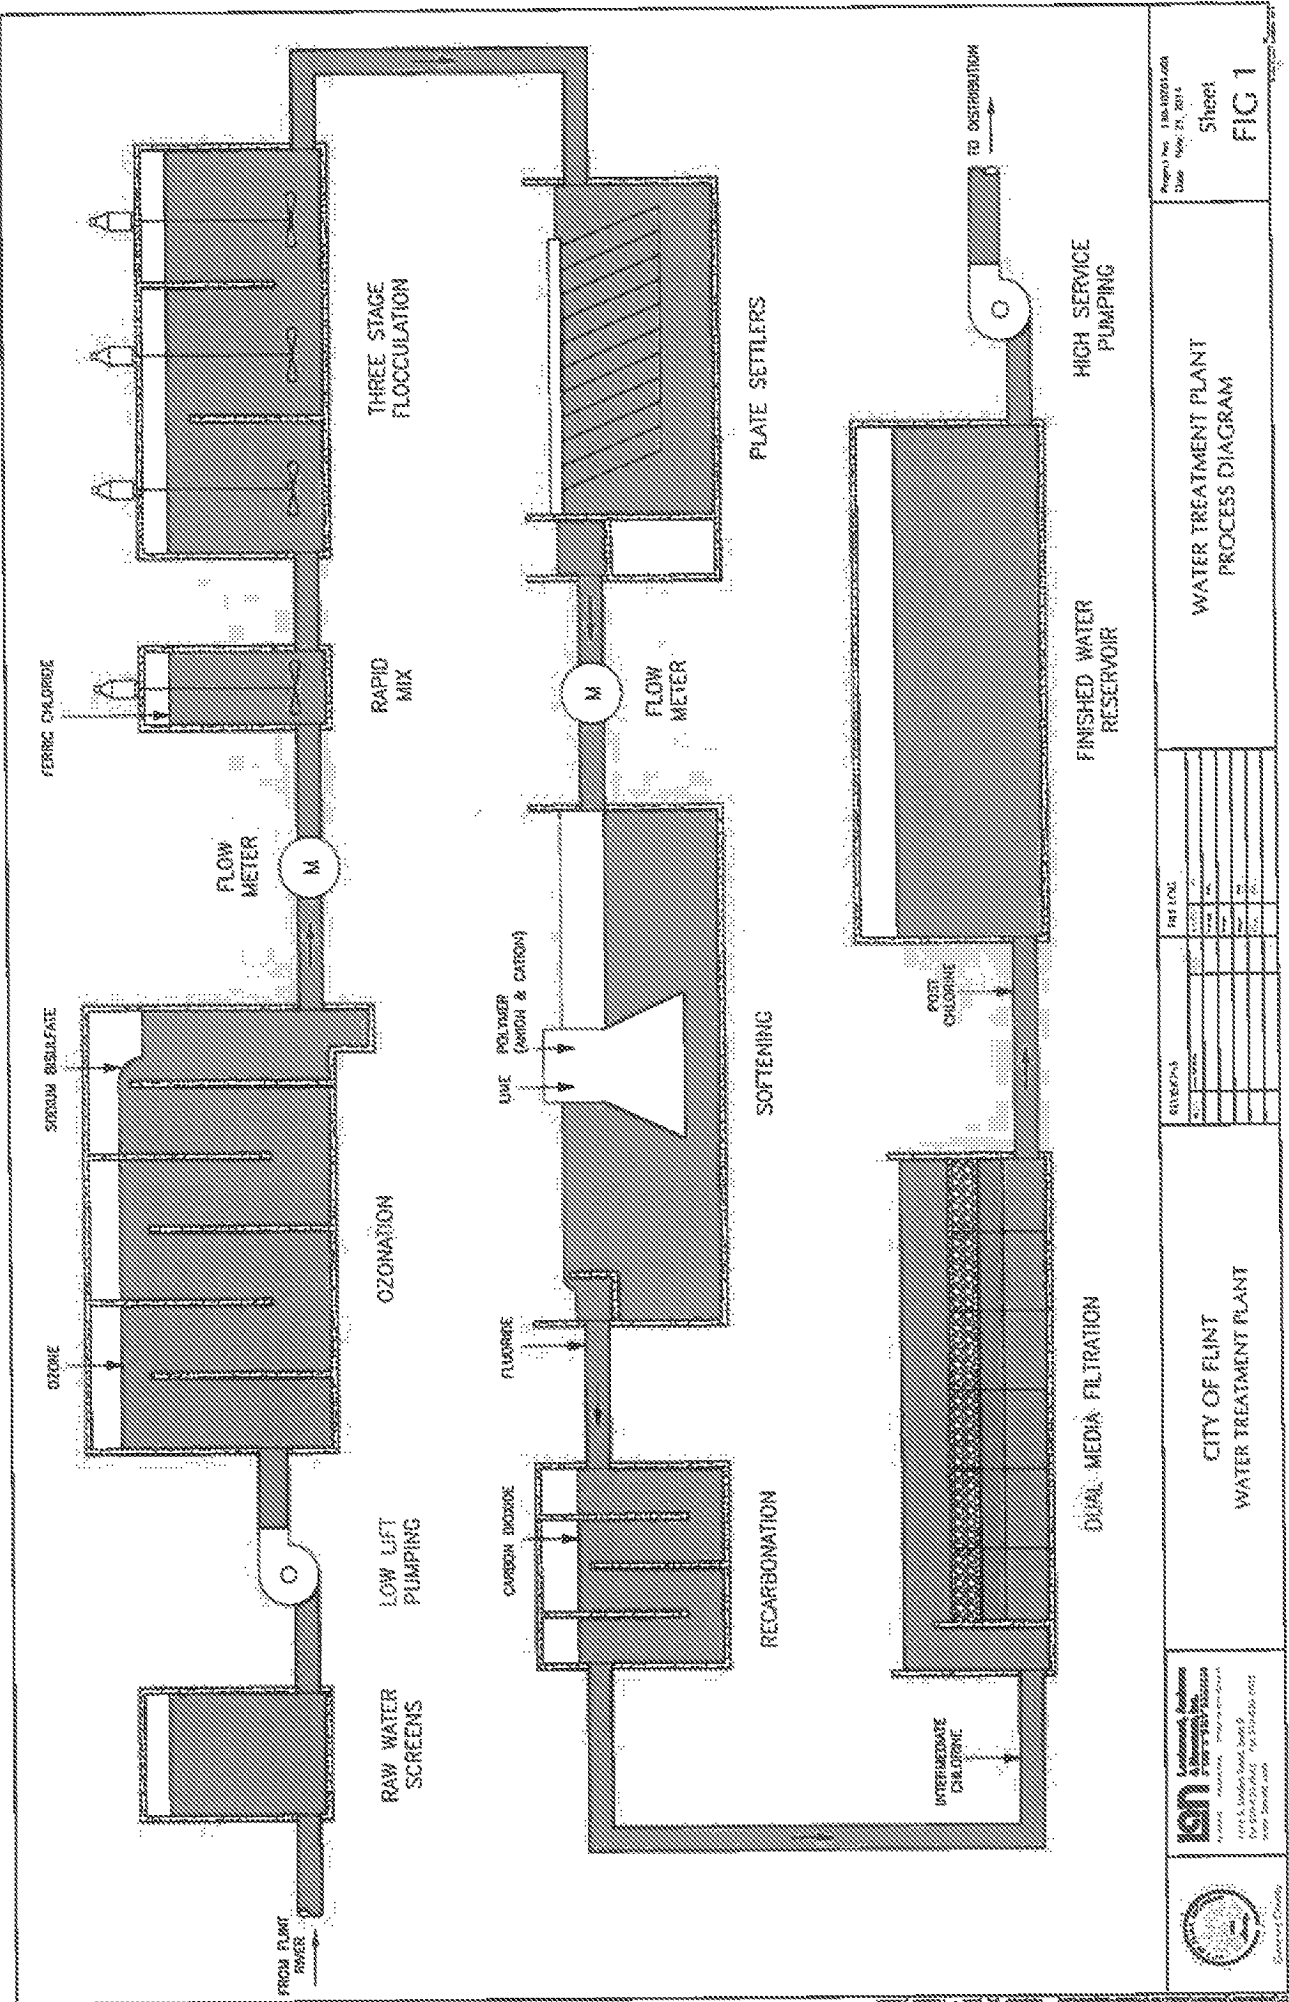

**TABLE 6 – ACTION PLAN**

	Action	Purpose
Stage 1	Troubleshoot ozone feed system	Reduce chlorine feed and increase TOC removal
	Bench scale jar testing	Optimize treatment process and evaluate possible modifications
	Discontinue softening bypass	Reduce chlorine demand
	Disinfect filters	Reduce chlorine demand
	Increased water main flushing	Reduce water age / stagnant water
	Water system modeling evaluation	Determine areas with high water age and reasons
	Implement coag. & floc. polymer aids	Increase TOC removal
Stage 2	Lower high water level in storage tanks	Decrease water age
	Repair ozone system	Reduce chlorine feed and increase TOC removal
	Continue increased water main flushing	Reduce water age / stagnant water
	Convert to lime and soda ash softening	Increase TOC removal
	Continue valve replacements based on water model	Reduce water age / stagnant water
	Change disinfectant to chlorine dioxide	Reduce THMFP
	Install pre-oxidant feed at intake	Optimize ozone disinfection, reduce chlorine
	Place priority on replacing cast iron water mains	Reduce chlorine demand

Samples were taken the week of November 17<sup>th</sup> for the 3<sup>rd</sup> quarter of testing. Although the City has begun implementation of Stage 1 actions, THM results are not expected to be noticeably affected since there has not been enough time for a response. The next quarter of sampling is due to be completed the third week in February. It is the City's intent to implement Stage 1 actions prior to the 3<sup>rd</sup> quarter of THM sampling. [need to make sure Flint is good with this]

## Water System Questions & Answers

January 13, 2015

## **CITY OF FLINT**

### **Department of Public Works**

**Dayne Walling**  
Mayor

**Gerald Ambrose**  
Emergency Manager

**Howard Croft**  
Director

**TO:** City of Flint Residents

**RE:** Water Questions

**DATE:** January 13, 2015

#### **Prelude**

The decision to switch to the Karegnondi Water Authority as the City's permanent water source was made following extensive research and in-depth engineering studies. After entering into a contract with KWA and the subsequent termination of the existing water service contract by the Detroit Water and Sewerage Department, the same diligence was given in determining what source water to use while waiting for the community supported KWA water to arrive. The City concluded from this work that the Flint River presented a safe and financially responsible alternative water source. The decision to use the Flint River as an intermediate water source was approved by state regulatory officials in 2014 whereby the City was permitted by the Michigan Department of Environmental Quality to proceed with treatment of water from the Flint River.

The following questions were presented by concerned citizens, and the City's responses follow. This document will be put on the City's website for public viewing within the next several days.

**1. What was the process by which the decision was made to switch from Detroit water to Flint River water? Who was responsible for what decisions?**

On March 25<sup>th</sup>, 2013, after evaluating cost comparisons for a permanent water source, the Flint City Council, with support from the Mayor, voted 7 – 1 approving a resolution to purchase water from the Karegnondi Water Authority (KWA). On March 29<sup>th</sup>, resolution 2013EM041 was signed, authorizing the City of Flint to enter into a contract with the KWA.

On April 16<sup>th</sup>, 2013, then Emergency Manager Ed Kurtz, signed the contract effectively purchasing 18 MGD of capacity from the KWA.

On April 17<sup>th</sup>, 2013 Detroit Water and Sewerage Department (DWSD) sent a letter terminating the existing water service contract between the City of Flint and Detroit. With the termination set to take effect 12 months later on April 17<sup>th</sup>, 2014, a gap was created between the end of the DWSD contract and the start of the KWA.

On June 29<sup>th</sup>, 2013, following many preliminary discussions on how the City would fill the interim gap, a formal, all day meeting was held at the Flint Water Plant with all interested parties including City of Flint Officials (COF), representatives from the Genesee County Drain Commissioners Office (GCDC), the Michigan Department of Environmental Quality (DEQ), and the design engineers from the previous plant upgrade Lockwood, Andrews, and Newnam (LAN).

The purpose and agenda of the meeting was to determine the feasibility of the following items:

1. Using the Flint River as a Water Source
2. The ability to perform the necessary upgrades to the Treatment Plant
3. The ability to perform quality control
4. The ability for Flint to provide water to Genesee County
5. The ability to meet an April/May 2014 timeline
6. Development of a cost analysis

The conversation was guided with focus on the engineering, regulatory, and quality aspects of each item listed. The resulting determinations were made.

1. Yes, the Flint River would be more difficult to treat but is viable as a source.
2. Yes, it was possible to engineer and construct the upgrades needed for the treatment process.
3. Yes, with support from LAN engineering which works with several water systems around the state, quality control could be addressed.
4. No, the Flint treatment plant would not have the capacity needed to treat and distribute sufficient water to meet the documented needs of Flint and Genesee County.
5. Possible, it was determined that many obstacles needed to be overcome but completion by the April/May 2014 target was reachable.
6. Next steps from the meeting were for LAN to present the City with a proposal that would include engineering, procurement, and construction needs for the project along with cost estimates.

As a result of extensive evaluation, discussions with the professional engineers, and consulting the state regulators, the Department of Public Works along with the Finance Department recommended utilizing the Flint River as a temporary water source while waiting for the KWA to come online. The plan to accomplish this was accompanied with a construction timeline, a needs analysis for resources, and an FY 14 spending plan to complete the project.

**2. Was it known prior to the switch that there would be problems managing total coliform and fecal coliform bacteria levels in the water?**

It was understood that the Flint River would be subject to temperature variations, rain events, and have higher organic carbon than Lake Huron water and would be more difficult to treat. These facts were balanced against a licensed staff, LAN engineering's extensive experience in this field, advanced equipment that Flint has for treatment, and support from the DEQ.

**3. What were the projected costs and benefits of the switch, and what have been the actual costs and benefits?**

The engineered costs for upgrading the Flint Plant to treat KWA water from Lake Huron were projected to be ~\$9,000,000. These upgrades need to be in place prior to KWA water reaching Flint and are coupled with an additional ~\$3,500,000 in annual operational expenses for workforce additions, electricity costs, and process equipment for a total of ~\$12,500,000.

The final year that the City of Flint purchased water from DWSD, the cost was \$12,400,000 and that cost was projected to rise to ~\$14,400,000 in 2014 and increase to ~\$16,000,000 in 2015.

The financial benefit for switching to the river was the opportunity to divert that revenue towards capitalizing the upgrade expenditures needed to run the plant and the development of a capital improvement program for the aged infrastructure without a significant increase to the water bill. This aspect was figured into the cost analysis at the time of the recommendation.

Based on the current DWSD rate structure, it appears that the actual costs to purchase water this year would have been higher than projected. The fixed cost would have been ~\$5,100,000 and the additional commodity or water costs would have resulted in another ~\$11,000,000 given the City's current water usage. This would result in an estimated ~\$16,000,000 in this year alone.

The upgrade expenditures stayed close to the engineered projections. The improvements at the water plant cost ~\$7,000,000, the remediation and development of Bray Rd for lime disposal cost ~\$1,700,000 and the increased operational costs so far this year are below the estimates and on target to finish the year at ~\$3,000,000. These changes come to a total of ~\$11,700,000 of necessary expenditures in the first year.

In addition to the ability to capitalize the upgrades, switching to the Flint River has allowed us to develop a Capital Improvement Plan for the Utility Department that will begin replacing pipe underground this spring and will account for overdue maintenance concerns such as valve replacements, and pipe lining extending the useful life of the system and allowing us to deliver better quality water.

It would have required close to a 30% raise in the water and sewer bill to accomplish this without using the Flint River as a source.

**4. What were the causes of increased levels of trihalomethanes? Have those causes been sufficiently addressed? If not, what needs to be done to prevent this from occurring again in the future?**

Just as low levels of chlorine can produce coliforms, high levels of chlorine can result in Disinfectant Byproducts (DBP) generating increased levels of trihalomethanes (TTHM). The DEQ requires this testing to occur once every three months at each of the testing sites and looks at an average over four quarters (one year) to determine the level to compare against the maximum contaminant level (MCL).

Research by the Science Advisory Board, the National Academy of Sciences, and the USEPA's Carcinogen Assessment Group predicts risk estimates associated with high levels of TTHM at an incremental risk of 3 to 4 people out of 10,000 that consume 2 liters of water over the MCL daily for 70 years.

The required remedy for this violation is to present the DEQ with an Operational Evaluation Report that assesses what caused the violation and what the proposed remedy is. The City generated a report to the DEQ in November 2014, which assesses each area of the Flint water system including water source, treatment process, and distribution system. The evaluation was complete with short and long term recommendations to optimize each area and the belief that the items listed would correct the violation and give Flint an increased ability to manage the system. Continued repairs on valves and colder temperatures have created a more consistent chemical footprint, and we have been producing a more consistent water quality.

**5. What were the causes of increased levels of total coliform and fecal coliform bacteria levels? Have those causes been sufficiently addressed? If not, what needs to be done to prevent this from occurring in the future?**

What we discovered is that as water travels through the 600 miles of the City's distribution mains it will, at times, reside in the system for up to 3 or 4 weeks. Water purchased from DWSD is drawn from Lake Huron, chlorinated, and then travels over 80 miles to reach the City. By the time the water reaches Flint it is stable and capable of withstanding this type of residency time within the system. Water drawn from the Flint River, specifically in summer months when the temperature is fluctuating, is more susceptible to being impacted by variables such as high residency times and increased chemical reaction.

The DEQ requires that a minimum of 100 tests be performed monthly for chlorine residuals at various locations throughout the system. When residual levels are too low, it creates an environment in which bacteria such as fecal coliform can grow. After switching sources, we encountered testing sites in June, 2014 that were consistently returning low residual levels. Several of these sites became areas that total coliform was eventually detected and ultimately boil water notices issued.

Low residual levels can sometimes trigger a positive test result for total coliform which is an indicator of a poor water environment but does not generally require a boil water notice. The normal course of action in these situations is to flush hydrants and introduce fresh water into the defined area. In certain areas this was successful and in other areas it was not. In a second course of action, the EPA also allows for water systems to increase the residual disinfectant, including chlorine, to a level and for a time necessary to protect public health. This information can be found in the EPA manual (40 CFR 141.65 & 141.130(d)). In contending with the low residual levels which represent a more immediate health concern along with the potential for tier 1 violations and boil water notices, we increased the chlorination treatment at times in order to combat the low residuals. This was also was an unsuccessful remedy and only after we located and replaced valves that were broken in the closed position on major transmission lines in these areas did the residual levels return to normal and have remained that way since.

There is still one test site, in the 2500 block of Flushing Rd. where we continue to experience low residual levels and we are actively pursuing efforts to locate more expected valve failures. The development of a hydraulic model of the system and the ability to use unidirectional flushing are tools that will assist us in mitigating areas where low residuals surface. Both of these are in progress of being developed by the engineering firm LAN and Potter Consulting who was also the author of our Water Reliability Study.

**6. What are the public reporting requirements for these sorts of problems, and has the City met those requirements? What can be done to communicate in a more timely manner useful information about a public health threat such as the presence of cancer-causing chemicals in our drinking water?**

The EPA 2010 "Revised Public Notification Handbook" has a specific breakdown of the elements required in public notifications and includes usable templates. The EPA has three different tiers associated with community water systems (CWS), each with specific timeframes and requirements that trigger upon issuance of the violation.

- Tier 1. CWS must provide public notification within 24 hours of a violation and continue this as directed by the primary agency.
- Tier 2. CWS must provide public notification within 30 days of a violation and continue this every three months until the violation is resolved
- Tier 3. CWS must provide public notification within one year and the EPA recommends repeat occurrences be provided in an annual notice

The current EPA violation is classified as a tier 2 violation and was issued December 16<sup>th</sup>, 2014.

Moving forward, the City of Flint is striving to increase communication with the public in a variety of ways.

- The city's new website will have current news and information updated on a regular basis.
- Increased data collection will be transitioned into real time ability to communicate with the residents through the Public Works area of the City's new website.
- Timely reporting of current test results on the new City website.

The establishment of these tools is in progress and expected to be implemented in the near future along with evaluating other avenues of communication.

**7. Is there any reason to think that these or similar problems will continue even after the shift is made to water from Lake Huron?**

The water coming from Lake Huron via KWA will be more consistent in temperature, have lower organic carbon, and will be less susceptible to variations but will have its own chemical footprint. The construction upgrades to the Flint Treatment Plant give us the ability to draw water from either source and should provide Flint the opportunity for testing and thereby streamlining the treatment process to match the Lake Huron chemical footprint before fully introducing it into the distribution system.

In addition to new source water, following the recommendations contained in the Operational Evaluation Report and the City's Water Reliability Study is the roadmap to being able to provide quality water.

Continuing to identify integrity issues and making preemptive repairs within our antiquated infrastructure are needed to maintain and provide a healthy system. Leak detection which is scheduled for the spring, hydraulic system modeling which includes unidirectional flushing is in progress now and will give us the information and tools to accomplish these goals.

**8. Who is responsible for making sure we don't have these sorts of problems, and did that person or those people fail to meet their responsibilities?**

The Utility Department is a Division underneath the Department of Public Works. The Public Works Director along with the Utilities Administrator will continue to work hand in hand with professional engineers, consultants, and the state regulatory agency DEQ in order to manage increased public communication and address any issues that arise going forward.

The DEQ requires that public water systems with population over 20,000 must have an F-1 state licensed operator in charge that oversees the operation of the treatment process. This license is the highest classification in the state that specializes in "complete treatment" The City of Flint has such a person on staff at the water plant and that person's responsibility is to determine the correct levels of chemical treatment, monitor the system, submit official test results to the state regulatory agency, and make necessary adjustments when contaminant levels are breached. All of these steps were followed and acknowledged by the DEQ.

The following is the list of supporting documents that will be available on the City's website for public viewing.

## Addressing Flint's Water Concerns: Water System Questions & Answers and Related Documents.

Posted by: [Jason Lorenz](#)

15  
JAN

Documents listed below. Keep checking back for updated information.

### Addressing Flint's Water Concerns

Recent events have raised concerns among many as to the safety and quality of the water provided by the City's utility system. The City is and continues to be committed to assuring that residents and visitors know that the water is safe and that those responsible for providing water are working every day to improve the quality of the water. The quality of the water does need improvement, but that is not to be confused with safety of the water. The recent notice by MDEQ clearly stated that the water provided by the utility system is safe to drink, but cautioned that some vulnerable groups may want to consult with their health care provider if they have concerns. The City remains committed to their efforts to assure that the water is safe for everyone and that quality is both improved and improving.

To date, the City has taken the following actions:

- As an integral part of the transition to the Flint River on a temporary basis, the MDEQ was consulted about the City's plans, and ultimately issued necessary permits to proceed. The City also engaged the services of the LAN engineering firm to guide the city in installing the necessary equipment to treat the water on an ongoing basis. This resulted in the development of a comprehensive drinking water plan.
- The City monitors its water quality on a daily basis to assure that water quality remains within established guidelines. With the variances in water temperature and the leakage and infiltration problems arising as the result of failure of parts of the distribution system, water quality did exceed, for a time, some of the established guidelines. This resulted in the issuance of the recent notices to the public. Upon receipt of information that some guidelines were exceeded, the City's priority focus was to bring water quality back within guidelines. Efforts taken to address non-compliance included increasing water flow through valve replacements and hydrant flushing and optimizing treatment processes.
- The City has committed to increasing communication with the public in order to inform water users factually of the issues which have arisen, to alleviate unnecessary concern and to identify the steps being taken to address the issues. This is being implemented through detailed and easy to understand educational materials being made available both online and at City Hall, as well as through ongoing public

.....

informational meetings.

- Most recently, in light of recent concerns raised by resident groups over the quality and safety of water, Department of Public Works Director Howard Croft and his staff collected questions from citizens during a recent public meeting. After reviewing these questions, DPW Director Croft and his staff set out to answer them in concise detail; the result of that work is a full Water System Questions and Answers document is available online. Along with the detailed information within, the document also contains links to other source documents and regulatory statutes found online which were used as reference. **"We want the residents, businesses and visitors of Flint to know that the water in Flint is safe and that we are working every day to make improvements to our system to ensure that," said Croft. "Our goal is make sure we get people the information on our efforts and assure them that we are on the right track with them."** More documentation, including regular water quality monitoring reports, will be made available.
- Additionally, a number of public meetings have and will continue to take place. Two of the most recent of these took place at the Antioch Baptist Church and the Mott Community College Regional Technology Center. These meetings were held by concerned neighborhood groups and were attended by Mayor Walling and DPW Director Croft. At both meetings, citizens voiced their concerns and asked questions about water quality and the recent violation notice. Director Croft offered detailed answers to common questions, but also offered to investigate specific water issues raised by residents in which the City could offer assistance. Those in attendance came away with a better understanding of the issues surrounding the drinking water in their community.
- The City of Flint will be hosting a water presentation on **Wednesday, January 21, 2015 at 7pm. That presentation will be held in the City Hall Dome** and will feature information detailing water treatment, water distribution and the steps being taken to ensure that citizens get water that meets all regulatory safety and quality standards. City DPW Director Howard Croft and Daugherty Johnson, Utilities Administrator, will be joined on a panel by representatives from the Genesee County Drain Commissioner's office, the Michigan Department of Environmental Quality and LAN engineering. Written questions from the audience will be collected during the presentation and answered by the panel after the presentation.
- The City of Flint has also determined that in light of the serious concerns raised, it will secure the services of an external firm with expertise in managing drinking water quality to assess the steps that the city has taken, to make recommendations as to other steps to be taken, to oversee their implementation, and to monitor operations until the City's water source becomes the KWA. A Request for Proposal was issued on January 15, 2015, with proposals due back on January 26.

#### **The DWSD Question:**

As a result of the concerns raised, several community members have suggested that the City reconnect to the Detroit Water and Sewer Department (DWSD). DWSD has advised that they would be willing to allow such a reconnection without a hook-up fee. However, the City would be obligated to pay a fixed monthly charge of \$846,700 plus the \$14.92/Mcf cost of water itself and agree to a long term arrangement. The City's analysis of the DWSD proposal concludes that the City's cost would increase by more than \$12 million per year at the proposed rates, and could increase even more as proposed rates are subject to change after July 1, 2015. This increase in costs would not be in the best interests of the City or its water users, as the City is committed to assuring safety and improving water quality by following its current plan, and reconnecting to DWSD would likely require deferment of existing capital improvements or an additional increase in rates.

The attached document contains questions presented to the City of Flint by concerned residents and the concise and detailed answers to them provided by our Department of Public Works.

## CoF Water System Q&A

RICK SNYDER  
GOVERNOR

STATE OF MICHIGAN  
DEPARTMENT OF ENVIRONMENTAL QUALITY  
LANSING DISTRICT OFFICE

DAN WYANT  
DIRECTOR

December 16, 2014

Mr. Brent Wright, Operation Supervisor  
City Of Flint - DPW  
Flint Water Plant  
4500 North Dort Highway  
Flint, MI 48505

WSSN: 02310

Dear Mr. Wright:

SUBJECT: Violation Notice – Maximum Contaminant Level for Total Trihalomethanes  
Operational Evaluation – Total Trihalomethanes  
4<sup>th</sup> Quarter 2014 Monitoring Period

The Department of Environmental Quality (DEQ), Office of Drinking Water and Municipal Assistance (ODWMA), records show that the City of Flint is in violation of the Safe Drinking Water Act, 1976 PA 399, as amended (Act 399); R 325.10610, *Maximum contaminant levels (MCL) for disinfection byproducts*, of the 1979 Administrative Code.

In accordance with R.325.10610, *MCLs for disinfection byproducts*, of the 1979 Administrative Code, the MCL for disinfection byproduct total trihalomethanes (TTHM) is 0.080 milligrams per liter (mg/L) as a Locational Running Annual Average (LRAA) at each monitoring location. As listed in the table below, our records show that the City of Flint's highest TTHM locational running annual average (LRAA), based on the last three quarters, ending November 30, 2014, is 0.099 mg/l which exceeds the standard, and that two of the eight sample site locations exceed the standard of 0.080 mg/L.

Further, in accordance with R325.10719, *Disinfection byproducts: operational evaluation levels*, of the 1979 Administrative Code, when an operational evaluation level (OEL) at a monitoring location for TTHM exceeds 0.080 mg/L, a supply shall conduct an operational evaluation and submit a written report of the evaluation to the department not later than 90 days after being notified of the analytical result that causes the supply to exceed the operational evaluation level. As listed in the table below, our records show that TTHM operational evaluation levels for the City of Flint exceed 0.080 mg/L at four of the City's eight sample site locations.

TTHM Results (mg/L)	5/21/14	8/21/14	11/20/14	LRAA	OEL
DBP1 McDonalds 3719 Davison	0.162	0.145	0.059	0.092	0.106
DBP2 Liquor Palace 3302 S. Dort Highway	0.112	0.127	0.033	0.068	0.076
DBP3 North Flint Auto 6204 N. Saginaw St.	0.097	0.118	0.041	0.064	0.074
DBP4 University Market 2501 Flushing Road	0.106	0.196	0.094	0.099	0.122
DBP5 Taco Bell 3606 Corunna Road	0.079	0.181	0.034	0.074	0.082
DBP6 Rite-Aid Pharmacy 5018 Clio Road	0.088	0.144	0.054	0.072	0.085
DBP7 Salem Housing 3216 MLK Boulevard	0.082	0.112	0.050	0.061	0.074
DBP8 BP Gas Station 822 S. Dort Highway	0.075	0.112	0.036	0.056	0.065

Our investigation consisted of a review of ODWMA files for laboratory reports received for compliance monitoring. Our investigation is considered complete. This violation began on December 1, 2014, and will continue until TTHM LRAA is below the MCL at all sample sites.

We acknowledge and appreciate the city's cooperation with our recommendation to preemptively conduct an Operational Evaluation following the City's second quarterly round of monitoring in August. That Operational Evaluation report has identified possible causes and corrective measures for the elevated TTHM levels which we encourage the City continue implementing. These modifications have likely contributed in part to the reduction in TTHM levels reported in the most recent quarter, and suggest the City may be able to achieve compliance with the TTHM standard.

Our office is continuing to review the Operational Evaluation report that was submitted on December 1, 2014, and will provide the City and their consultant comments as needed to help address this MCL violation.

Water systems that exceed the OEL must complete and submit an Operational Evaluation in accordance with Administrative Rule 719I (R325.10719I) within 90 days of being notified of the violation. An updated Operational Evaluation report, which incorporates the most recent sample results, must now be completed and received by our office by no later than March 1, 2015.

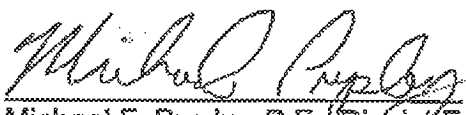

If you have any other factual information you would like us to consider regarding the violation identified in this Violation Notice (VN), please provide them in a written response by January 16, 2015.

Administrative rule R 325.10403 of Act 399 requires that suppliers provide public notice (PN) as soon as practical, but no later than thirty (30) days after the supplier learns of this type of violation, by mail or direct delivery and by any other means reasonably calculated to reach customers not normally reached by mail. Enclosed is a sample PN

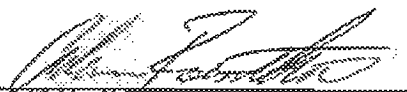

which contains the minimum required language. The City is encouraged to include additional information regarding its response to this violation. Please notify your consumers by January 10, 2015, and send us a signed and dated copy of the notice that you issued within ten (10) days of distributing the public notice. This violation must also be included in your 2014 Consumer Confidence Report (CCR), due by July 1, 2015. The PN must be repeated every quarter until you no longer exceed the TTHM standard. Failure to issue a PN for this violation will result in a fine of at least \$1,000 per event, with a maximum of \$5,000 per violation.

We anticipate and appreciate your continued cooperation in resolving this matter. If you have any questions regarding this VN, please contact us at the numbers below.

Sincerely,

Michael F. Prysby, P.E., District Engineer

## IMPORTANT INFORMATION ABOUT YOUR DRINKING WATER

### City of Flint Did Not Meet Treatment Requirements

Our water system recently violated a drinking water standard. Although this incident was not an emergency, as our customers, you have a right to know what happened and what we are doing to correct this situation.

We routinely monitor for the presence of drinking water contaminants. Samples were collected for total trihalomethanes (TTHM) analysis from eight locations on a quarterly basis (May 21, August 21, and November 20 of 2014). The average of the results at ANY of the eight locations must not exceed the maximum contaminant level (MCL) for TTHMs, otherwise our water system exceeds the Maximum Contaminant Level (MCL). The standard for TTHMs is 80 µg/L. The location reporting the highest TTHM level was 99 µg/L; thus, our water system exceeds the TTHM MCL.

#### What should I do?

- There is nothing you need to do unless you have a severely compromised immune system, have an infant, or are elderly. These people may be at increased risk and should seek advice about drinking water from their health care providers.
- You do not need to boil your water or take other corrective actions. If a situation arises where the water is no longer safe to drink, you will be notified within 24 hours.

#### What does this mean?

This is not an emergency. If it had been an emergency, you would have been notified within 24 hours.

*People who drink water containing trihalomethanes in excess of the MCL over many years may experience problems with their liver, kidneys, or central nervous system, and may have an increased risk of getting cancer.*

#### What is being done?

We are currently working on solutions to correct the problem. We anticipate resolving the problem by 2015.

For more information, please contact Mr. Brent Wright at 517-787-6537 or the Flint Water Plant at 4500 North Dort Highway, Flint, MI 48505.

*Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.*

This notice is being sent to you by the City of Flint.

#### CERTIFICATION:

WSSN: 02310

I certify that this water supply has fully complied with the public notification requirements in the Michigan Safe Drinking Water Act, 1976 PA 399, as amended, and the administrative rules.

Signature

Date Distributed

Reminder to water supplier: This notice / certification must be sent to the DEQ.

**§141.65 Maximum residual disinfectant levels.**

(a) Maximum residual disinfectant levels (MRDLs) are as follows:

Disinfectant residual	MRDL (mg/L)
Chlorine	4.0 (as $\text{Cl}_2$ ).
Chloramines	4.0 (as $\text{Cl}_2$ ).
Chlorine dioxide	0.8 (as $\text{ClO}_2$ ).

(b) *Compliance dates*—(1) *CWSs and NTNCWSs*. Subpart H systems serving 10,000 or more persons must comply with this section beginning January 1, 2002. Subpart H systems serving fewer than 10,000 persons and systems using only ground water not under the direct influence of surface water must comply with this subpart beginning January 1, 2004.

(2) *Transient NCWSs*. Subpart H systems serving 10,000 or more persons and using chlorine dioxide as a disinfectant or oxidant must comply with the chlorine dioxide MRDL beginning January 1, 2002. Subpart H systems serving fewer than 10,000 persons and using chlorine dioxide as a disinfectant or oxidant and systems using only ground water not under the direct influence of surface water and using chlorine dioxide as a disinfectant or oxidant must comply with the chlorine dioxide MRDL beginning January 1, 2004.

(c) The Administrator, pursuant to Section 1412 of the Act, hereby identifies the following as the best technology, treatment techniques, or other means available for achieving compliance with the maximum residual disinfectant levels identified in paragraph (a) of this section: control of treatment processes to reduce disinfectant demand and control of disinfection treatment processes to reduce disinfectant levels.

**§141.130 General requirements.**

(a) The requirements of this subpart L constitute national primary drinking water regulations.

(1) The regulations in this subpart establish criteria under which community water systems (CWSs) and nontransient, noncommunity water systems (NTNCWSs) which add a chemical disinfectant to the water in any part of the drinking water treatment process must modify their practices to meet MCLs and MRDLs in §§141.64 and 141.65, respectively, and must meet the treatment technique requirements for disinfection byproduct precursors in §141.135.

(2) The regulations in this subpart establish criteria under which transient NCWSs that use chlorine dioxide as a disinfectant or oxidant must modify their practices to meet the MRDL for chlorine dioxide in §141.65.

(3) EPA has established MCLs for TTHM and HAA5 and treatment technique requirements for disinfection byproduct precursors to limit the levels of known and unknown disinfection byproducts which may have adverse health effects. These disinfection byproducts may include chloroform; bromodichloromethane; dibromochloromethane; bromoform; dichloroacetic acid; and trichloroacetic acid.

(b) *Compliance dates*—(1) *CWSs and NTNCWSs*. Unless otherwise noted, systems must comply with the requirements of this subpart as follows. Subpart H systems serving 10,000 or more persons must comply with this subpart beginning January 1, 2002. Subpart H systems serving fewer than 10,000 persons and systems using only ground water not under the direct influence of surface water must comply with this subpart beginning January 1, 2004.

(2) *Transient NCWSs*. Subpart H systems serving 10,000 or more persons and using chlorine dioxide as a disinfectant or oxidant must comply with any requirements for chlorine dioxide in this subpart beginning January 1, 2002. Subpart H systems serving fewer than 10,000 persons and using chlorine dioxide as a disinfectant or oxidant and systems using only ground water not under the direct influence of surface water and using chlorine dioxide as a disinfectant or oxidant must comply with any requirements for chlorine dioxide in this subpart beginning January 1, 2004.

(c) Each CWS and NTNCWS regulated under paragraph (a) of this section must be operated by qualified personnel who meet the requirements specified by the State and are included in a State register of qualified operators.

(d) *Control of disinfectant residuals*. Notwithstanding the MRDLs in §141.65, systems may increase residual disinfectant levels in the distribution system of chlorine or chloramines (but not chlorine dioxide) to a level and for a time necessary to protect public health, to address specific microbiological contamination problems caused by circumstances such as, but not limited to, distribution line breaks, storm run-off events, source water contamination events, or cross-connection events.

## EXECUTIVE SUMMARY

Special Pathogens Laboratory (SPL) was contacted by McLaren Flint Health Care to assist the hospital in responding to an increase in the incidence of Legionnaires' disease due to *Legionella pneumophila*, serogroup 1. The Genesee County Health Department had also been in contact with the hospital regarding cases of Legionnaires' disease in patients that had been diagnosed and treated at the hospital. This increase in cases had been observed over the past year when water quality in Flint was adversely affected when the city switched from Detroit water to the Flint River last year. SPL was asked to provide consultation services, including an on-site risk assessment, review of the facility's current Legionella policy, and development of a Water Safety Plan for the facility.

Assessments of McLaren Flint Hospital buildings were performed from August 11 - 13, 2015. The assessment including collection of samples for *Legionella* culture from distal hot water sites, distal cold water sites, hot water heaters, a hot water return, and the cold water entries. Physicochemical measurements, including pH, temperature, and free chlorine, were also taken.

*Legionella pneumophila* serogroup 1 was detected across all systems, with the majority of hot water distal sites (water outlets) showing some level of positivity.

McLaren Flint Hospital Administration, Infectious Diseases, Facilities Engineering and Infection Control acted aggressively to address the potential risk for hospital-acquired Legionnaires' disease. Staff worked with SPL to expedite both short and long-term approaches to prevention. This included recommendations for

rapid identification and treatment of cases as well as recommendations regarding options for installation of secondary water treatment (disinfection).

The hospital staff performed a "shock" hyperchlorination disinfection in Buildings F, A, and B/C. The hyperchlorination disinfection for Building F Upper System was completed on August 14-15, 2015 and re-sampled for *Legionella* on August 17, 2015.

The "post-disinfection" culture results showed that *Legionella* concentrations were significantly lower—indicating the hyperchlorination disinfection was a successful short-term remediation which temporarily reduced *Legionella*.

Long-term secondary disinfection with monochloramine was recommended in patient care areas because of its proven efficacy and ability to rapidly reduce *Legionella* in hospital hot water systems. A Water Safety Plan is being developed to provide on-going risk management and to comply with the new ASHRAE 188 *Legionella* standard.

These efforts have resulted in successfully reducing *Legionella* in the hospital water systems. No cases of healthcare-acquired Legionnaires' disease were identified following these measures.

Aug 2014

Over the past several weeks, there has been an increase in the number of Legionella cases throughout Genesee County. Although a clear source for this increase has not been specifically identified, McLaren Flint is taking proactive and precautionary measures to ensure that we are implementing all recommended practices and safety measures in the prevention and elimination of Legionella in the water system at our facility. In this initiative, we are working in partnership with the Genesee County Health Department and have engaged with leading experts in this field.

Beginning Friday, August 14, we are taking the following steps:

1. Adding additional chlorine to our water supply, while still maintaining levels well within safe drinking standards;
2. Providing bottled water for drinking while we are implementing specific measures. Patients will receive bottled water with all meals, and it will also be available on the unit throughout the day. Employees will also have access to bottled water for drinking purposes.
3. Implementing hyperchlorination of our water system to reinforce the routine, twice-a-year hyperchlorination process that was last implemented in April.
4. Continuing surveillance testing of our water to ensure consistent quality standards.

We understand these implementations may interrupt daily routines and appreciate your support as we work together to maintain a healthy environment for our patients, visitors and staff.

As additional resources, we are including with this update information outlining frequently asked questions and facts about Legionella.

***For any further information, please contact  
Infection Control at (810) 342-2290.***

## What is Legionnaires' disease?

Legionnaires' disease is a lung infection (pneumonia) caused by a bacterium named *Legionella pneumophila*. The name *Legionella pneumophila* was derived from the original outbreak at the 1976 American Legion Convention in Philadelphia. *Pneumophila* means "lung loving" in Greek.

## Where do *Legionella* bacteria come from?

*Legionella* are natural inhabitants of water and can be detected in rivers, lakes, and streams. The bacteria are commonly found in the water systems of buildings and households, but pose little risk to healthy adults and children. One type of *Legionella* species (*L. longbeachae*) has been found in potting soil.

## What are the most common symptoms?

Legionnaires' disease can have symptoms like many other forms of pneumonia, so it can be hard to diagnose at first. Signs of the disease can include: a high fever, chills, cough, and confusion. Some people may also suffer from muscle aches and headaches. Symptoms usually begin two to 10 or 14 days after being exposed to the bacteria.

## Is Legionnaires' disease contagious?

Legionnaires' disease is not contagious. No special precautions, or isolation of the patient is necessary. The disease is transmitted via drinking water not by infected persons. It requires direct exposure to the bacteria—usually by aerosolized water mist that is inhaled or aspiration.

## Who is at greatest risk for contracting Legionnaire's disease?

People at risk for contracting Legionnaires' disease following exposure to water that contains *Legionella* are usually 65 years or older, smokers, patients with chronic lung disease, and those with weakened immune systems. People who have had a bone marrow or solid organ transplant have the greatest risk of contracting *Legionella* pneumonia.

## How is Legionnaires' disease treated?

Many antibiotics are highly effective against *Legionella* bacteria. The two most effective antibiotics are levofloxacin and azithromycin.

# Legionella Facts

1. Legionnaires' disease is a form of bacterial pneumonia caused by the bacteria *Legionella* found in building water systems.
2. *Legionella* bacteria are naturally found in municipal cold water, but can grow in high numbers in warm water after entering a building's hot water system.
3. How much *Legionella* grows depends on the temperature. The ideal temperature range is between 95 and 110 degrees.
4. Brown water events and water pressure changes in pipes can increase *Legionella* in building water systems.
5. Legionnaires' disease causes a small percentage, only about 2 to 5% of the average 600,000 pneumonia cases that require hospitalization each year.
6. Even if the bacteria enter the lungs, either by inhalation or aspiration drinking water or water droplets, the majority of persons exposed won't become ill. The likelihood for illness is greatest for persons with chronic lung disease (smokers, COPD), those taking high dose steroids, diabetics, patients who have had transplants or persons with compromised immune systems (e.g. cancer).
8. Diagnosis of Legionnaires' disease requires a specific test—urine antigen—which must be ordered by a physician. Cases are often missed when physicians don't consider Legionnaires' disease as a possible illness. It is often not diagnosed and is under reported for these reasons.
9. Rapid diagnosis and effective treatment are key to minimizing the severity of the disease and in preventing mortality.
10. Approaches to preventing exposure of at risk patient populations to *Legionella* bacteria in water include:
  - Using sterile water with equipment such as nasogastric and endotracheal tubes, TEE probes, etc.
  - Providing bottled water for drinking when cases of hospital-acquired Legionnaires' disease have been identified and until after water is treated to control *Legionella*.
  - Since there is no person-to-person spread of *Legionella* bacteria, disease prevention is accomplished by additional treatment of the warm water system to control and prevent the growth of *Legionella*.

- *Legionella* spp. in 47% Flint water sites
- High concentrations of 2500 gene copies/mL
- No *L. pneumophila* detected

# Legionellosis Public Health Data

- 46 cases reported by 3<sup>rd</sup> week in November in Genesee
- On pace for 12.5 cases per 100k citizens
- Almost 10 times the national average of 1.3/100k
- African Americans have 50% higher incidence than whites
- Multiple concurrent LD cases in Flint hospitals
- Sources not traceable: no outbreak confirmed
- OPPPs were predicted to be a potential public health issue with the switch to Detroit water

# Sampling Regime

- 62 one liter water samples from public sinks
- Cold first draw followed by hot post-flush
- Sampled afternoon of 10/15 and morning of 10/16
- Tested for wide range of metals on cold samples
- Measured flow, temperature, and chlorine on site
- Performed DNA based analysis for *Legionella* spp. and *L. pneumophila*

# Physical Data

- No elevated levels of metals were detected
- 70% hot water temperature in ideal growth range
- 87% cold water temperature at/near growth range
- 60% taps under ideal chlorine residual
- 0% taps reached scalding temperatures

# Microbial data

	<i>Legionella</i>	<i>L. pneumophila</i>
Hot % (n=29)	97	93
Hot Max Concentration	66018	5408
Cold % (n=30)	77	60
Cold Max Concentration	119028	4237
Combined % (n=59)	86	76
Combined Mean Concentration	14123	1969

- Concentrations in gene copies/mL
- Samples have yet to be re-tested for assay inhibition
- Number of positives may increase with additional analysis

# Summary

- High frequency and concentration of both *Legionella* and *L. pneumophila* measured

# Solution Involves Coordination of 3 Activities

# Optimize Plant Process

All dependent on  
implementing advanced  
management techniques  
at the plant

Optimized data

f

# Make It Easy to Access Information and People

## Develop a proactive customer communication plan

- Create advisory committees to help direct efforts and improve flow of information
- Add additional communication personnel for the utility
- Develop a proactive communication program
- Establish a single point of contact to manage all water quality complaints
- Provide additional customer service training and tools to staff
- Expand neighborhood and community outreach
- Change monthly billing statements from card to envelope with information

Questions?

		The concentration of a contaminant, which, if exceeded, triggers treatment or other requirements which a water system must follow.
		HAA5 is the total of bromoacetic, chloroacetic, dibromoacetic, dichloroacetic, and trichloroacetic acids. Compliance is based on the total.
	Sum/Average	
	Level	The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
	Level Goal	The level of contaminant in drinking water below which there is no known or expected risk to health.
	Disinfectant Level	The highest level of disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
	Disinfectant Level Goal	The level of a drinking water disinfectant below which there is no known or expected risk to health. MRLDG's do not reflect the benefits of the use of disinfectants to control microbial contaminants.
	Units	Measures the cloudiness of water.
	One billion)	The ppb is equivalent to micrograms per liter. A microgram = 1/1000 milligram.
	One million)	The ppm is equivalent to milligrams per liter. A milligram = 1/1000 gram.
	Average	
	Requirement	A required process intended to reduce the level of a contaminant in drinking water.
	Notes:	Total Trihalomethanes is the sum of chloroform, bromodichloromethane, dibromochloromethane and bromoform. Compliance is based on total.

Department of Utilities

City of Flint

Water Plant & Facilities

## 2013 Consumers Annual Report on W

The City of Flint Department of Utilities is dedicated to providing residents of the community. The Consumers Annual Report on Water Q about your drinking water. This report includes information about the so a chart summarizing United States Environmental Protection Agency (U table giving explanations of important terms to understand when viewin & Facilities operates and maintains a certified drinking water laboratory federal regulations and is committed to prompt and thorough notification for concern about the quality of the drinking water.

5. Sewerage Department, and the Michigan Public Health Institute performed the susceptibility of potential contamination. The susceptibility rating was "very high" based primarily on geologic sensitivity, water chemistry, and water intake is categorized as having a moderately low susceptibility. The water treatment plant has historically provided satisfactory treatment standards. If you would like to know more information or a complete copy of the report, please call (810) 787-6537.

6. To protect the public health, the EPA prescribes regulations, which limit the amount of contaminants in the public water systems. The Food and Drug Administration (FDA) has established maximum allowable levels for contaminants in public water, which must provide the same protection for public water, may reasonably be expected to contain at least small amounts of contaminants does not necessarily indicate that water poses a health risk. More information on health effects can be obtained by calling the EPA's Safe Drinking Water Hotline at (800) 426-4791.

7. Surface water (water from rivers, lakes, streams, ponds, reservoirs, etc.) and groundwater (water from the ground) are naturally occurring and can pick up substances resulting from the presence of animals or plants. These substances may be present in source water include:

- Pesticides and herbicides, which may come from agricultural plants, septic tanks, and wildlife.

- Metals and minerals, which can be naturally-occurring or result from urban storm water runoff, oil and gas production, mining, or farming.

- Radon, which can come from a variety of sources such as agriculture, urban storm water runoff, and natural gas production.

- Volatile organic chemicals, which are by-products of industrial processes, and can also come from gas stations, urban storm water runoff, and household products.

- Inorganic chemicals, which can be the result of oil and gas production and natural gas production.

8. Contaminants in drinking water can be a concern for the general population. Immunocompromised individuals, pregnant women, and young children are more susceptible to waterborne diseases. Persons who have undergone organ or bone marrow transplantation, and infants can be particularly at risk. EPA/CDC provides advice about drinking water from their health care providers. EPA/CDC provides information on the risk of infection by Cryptosporidium and other microbial contaminants. For more information, call the Safe Drinking Water Hotline at (800) 426-4791.

9. To ensure serious health problems, especially for pregnant women and young children, it is important to be aware of the health risks associated with service lines and home water systems. It is responsible for providing high quality drinking water, but cannot ensure the water is safe. When your water has been sitting for several hours, test the water before drinking it.

Nitrate	05/13/2013	ppm	10	0.32	nd
Barium	09/20/08	ppm	2	0.01	nd

Disinfection By-Products - Monitoring in Distribution System					
Contaminant	Test Date	Units	Health Goal MCLG	Allowed Level MCL	Highest LRAA Range Detect
Total Trihalomethanes (TTHM)	2013	ppb	n/a	80	37.8 11.5 -
Halacetic Acids (HAA5)	2013	ppb	n/a	60	17.0 6.0 - 1

Disinfectant Residuals Monitoring in Distribution System					
Contaminant	Test Date	Units	Health Goal MRDGL	Allowed Level MRDL	Highest RAA Range Detect
Disinfectant Total Chlorine Residual	Jan-Dec 2013	ppm	4	4	0.81 0.65-0

2013 Turbidity - Monitored every 4 hours at Plant Finished Water Tap		
Highest Single Measurement	Lowest Monthly % of Samples Meeting Turbid Limit of 0.3 NTU (minimum 95%)	
0.28 NTU	100%	
Turbidity is a measure of the cloudiness of water. We monitor it because it is a good indicator of the effectiveness of the disinfection process.		

2013 Microbiological Contaminants - Monthly Monitoring in Distribution System				
Regulated Contaminant	MCLG	MCL	Highest Number Detected	
Total Coliform Bacteria	0	Presence of Coliform bacteria > 5% of monthly samples	1	in one month
E.coli or Fecal Coliform Bacteria	0	A routine sample and a repeat sample are total coliform positive, and one is also fecal or E. coli positive.	0	entire year

2011 Lead and Copper Monitoring at Customers' Tap					
Regulated Contaminant	Test Date	Units	Health Goal MCLG	Action Level AL	90th Percentile Value* Number of Samples Over AL
Lead	2011	ppb	0	15	< 2.0 0
Copper	2011	ppm	1.3	1.3	0.10 0
*The 90th percentile value means 90 percent of the homes tested have lead and copper levels below the value is above the AL additional requirements must be met.					

Regulated Contaminant	Treatment Technique	
Total Organic Carbon	The Total Organic Carbon (TOC) removal ratio is calculated as the ratio of TOC removed to the TOC entering the treatment process. The TOC is	

Goal	The concentration of a contaminant, which, if exceeded, triggers treatment or other requirements which a water system must follow.
Details	HAA5 is the total of bromoacetic, chloroacetic, dibromoacetic, dichloroacetic, and trichloroacetic acids. Compliance is based on the total.
Annual Average	The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
Maximum Level	The level of contaminant in drinking water below which there is no known or expected risk to health.
Health Level Goal	A milligram = 1/1000 gram 1 milligram per liter is equal to 1ppm
Infected Level	The highest level of disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
Infected Level Goal	The level of a drinking water disinfectant below which there is no known or expected risk to health. MRLDG's do not reflect the benefits of the use of disinfectants to control microbial contaminants.
Life	
Ad	
Ability Units	Measures the cloudiness of water.
1 liter	A measure of radioactivity. Picocurie (pCi) means the quantity of radioactive material producing 2.22 nuclear transformations per minute.
in one billion)	The ppb is equivalent to micrograms per liter. A microgram = 1/1000 milligram.
in one million)	The ppm is equivalent to milligrams per liter. A milligram = 1/1000 gram.
Storage	
Multiple	A required process intended to reduce the level of a contaminant in drinking water.
Organics	Total Trihalomethanes is the sum of chloroform, bromodichloromethane, dibromochloromethane and

Regulated Contaminant	Test Date	Unit	Health Goal MCLG	Allowed Level MCL	Level Detected	
Combined Radium	5/13/14	pCi/l	0	5	0.06 + m - 0.05	

Michigan Department of Environmental Quality in partnership with the U.S. Environmental Protection Agency, and the Michigan Public Health Institute performed a study to determine the susceptibility of potential contamination. The susceptibility rating is a "very high" based primarily on geologic sensitivity, water chemistry, and the fact that water intake is categorized as having a moderately low susceptibility to contamination. The water treatment plant has historically provided satisfactory treatment of water. If you would like to know more information or a complete copy of the report, please call (810) 787-6537.

To drink, the EPA prescribes regulations, which limit the amount of certain contaminants in drinking water. The Food and Drug Administration (FDA) regulates the safety of food and drugs, which must provide the same protection for public health. Drinking water, like food, is expected to contain at least small amounts of some contaminants. The presence of contaminants in water poses a health risk. More information about contaminants and potential health effects can be found at EPA's Safe Drinking Water Hotline (800-426-4791).

Drinking water and bottled water include rivers, lakes, streams, ponds, reservoirs, springs, and wells. It can be surface water or groundwater, and it dissolves naturally occurring minerals and can pick up substances resulting from the presence of animals or other sources in source water include:

- Inorganic substances, which may come from sewage treatment plants, septic systems, and wildlife.

- Organic chemicals, which can be naturally-occurring or result from urban storm water runoff, industrial discharges, oil and gas production, mining, or farming.

- Radon, which can come from a variety of sources such as agriculture, urban storm water runoff, and natural gas production.

- Synthetic and volatile organic chemicals, which are by-products of industrial processes, and can also come from gas stations, urban storm water runoff, and natural gas production.

- Naturally occurring or be the result of oil and gas production and natural gas production.

- Contaminants in drinking water than the general population. Immunocompromised people, such as those undergoing chemotherapy, persons who have undergone organ transplants, and infants, and infants can be particularly at risk of infection by Cryptosporidium and other microbial contaminants. For more information, call the Safe Drinking Water Hotline (1-800-426-4791).

- Serious health problems, especially for pregnant women and young children. Lead in drinking water can be particularly harmful to children. It is possible to reduce lead in drinking water by using bottled water for drinking and cooking. Lead in drinking water can also come from lead pipes, solder, and flux used in home plumbing. Lead in drinking water can also come from lead-based paint in homes built before 1960. Lead in drinking water can also come from lead-based paint in homes built before 1960. Lead in drinking water can also come from lead-based paint in homes built before 1960.

## City of Flint 2014 Annual Water Quality Report

The Consumers Annual Water Quality Report provides important information about your drinking water. This report includes information about the source of the water, health information, charts that summarize regulatory required testing results, and a table giving explanations of important terms to understand when viewing the test results. The City of Flint Department of Utilities is dedicated to providing quality drinking water to the residents of the community. The Flint Water Plant operates and maintains a certified drinking water laboratory to assure compliance with all state and federal regulations, and is committed to prompt and thorough notification to the consumers if there is any reason for concern about the quality of the drinking water. Information about your drinking water is available on the City of Flint web page at [www.cityofflint.com](http://www.cityofflint.com) or by calling the City of Flint Water Plant at (810) 787-6537. The Safe Drinking Water Hotline at (800) 426-4791 is a resource for health related questions and water quality issues. General drinking water information can also be found on the U.S. Environmental Protection Agency (EPA) web site at [www.epa.gov/safewater/](http://www.epa.gov/safewater/).

Customer Service Center  
City Hall  
1101 S. Saginaw St.  
Flint, MI 48501

## Water Source

The City of Flint began using the Flint River as a water source in May of 2014. Flint is located roughly in the middle of the Flint River Watershed. The Flint River watershed includes Holloway Reservoir, C.S. Mott Lake, Kearsley Lake, and numerous streams and creeks that drain to these lakes or directly into the Flint River. The Michigan Department of Environmental Quality in partnership with the U.S. Geological Survey, and the City of Flint Utilities Department conducted a source water assessment in February 2004 to determine the susceptibility of potential contamination. The susceptibility rating is a seven-tiered scale ranging from "very low" to "very high" based primarily on geologic sensitivity, water chemistry, and contaminant sources. The Flint River source water intake is categorized as having a very high susceptibility to potential contaminant sources. If you would like to know more information or a complete copy of the report, contact the City of Flint Water Plant at (810)787-6537.

The use of the Flint River as a source water for the City of Flint Water Treatment Plant was a temporary move, driven largely by economics and the financial state of the City. The City of Flint joined the Karegnondi Water Authority (KWA) in 2010. The KWA consists of a group of local communities that decided to support and fund construction of a raw water pipeline to Lake Huron. The KWA will provide the City of Flint Water Treatment Plant with source water from Lake Huron. The KWA pipeline is currently under construction, and is scheduled to be completed by the end of 2016.

KWA pipeline construction

## General Information

In order to ensure that tap water is safe to drink, the EPA prescribes regulations, which limit the amount of certain contaminants in water provided by the public water systems. The Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water, which must provide the same protection for public health. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (800-426-4791).

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include:

- ◆ Microbial contaminants; such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- ◆ Inorganic contaminants; such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- ◆ Pesticides and herbicides; which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- ◆ Organic chemical contaminants; including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- ◆ Radioactive contaminants; which can be naturally occurring or be the result of oil and gas production and mining activities.

## General Information (cont.)

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Infants and young children are typically more vulnerable to lead in drinking water than the general population. It is possible that the lead levels at your home may be higher than at other homes in the community as a result of materials used in your home's plumbing. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Flint Department of Utilities is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. If you are concerned about elevated lead levels in your home's water, you can minimize your potential exposure to lead in your water by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

## Current Drinking Water Issues

The City of Flint experienced drinking water issues in the summer of 2014. Issues began with areas of the city experiencing "rusty" water. This was largely due to the city distribution system, which contains hundreds of miles of cast iron pipe. As these pipes age and degrade, iron is released, causing the water to exhibit color. Other contributors to this issue include water main breaks and repairs, routine distribution system maintenance, and a source water change which exposed the pipes to a slightly different water chemistry.

The City of Flint received violations from the Michigan Department of Environmental Quality (MDEQ). A violations for total coliforms and *E. coli* in September, and a corresponding total trihalomethane (TTHM) violation in December. As routine sample site testing in the city distribution system began to detect bacteria, system flushing increased, and chlorine addition at the water treatment plant also increased. The resulting increased chlorine addition then resulted in the higher formation of THM's through the warm weather months.

While facing these issues, the City of Flint took steps to confer with industry professionals and state regulators in regards to treatment plant operation and distribution system operation. In the fall, as water temperatures dropped, and improvements were completed in the distribution system, THM levels were below the maximum contaminant level during routine November monitoring at 7 of the 8 monitoring sites.

## Moving Forward

The City of Flint has taken many steps to help correct the underlying issues that resulted in drinking water violations. Water treatment plant and distribution system corrective actions that were taken or are currently in progress include:

- Limiting the use of storage reservoirs during the warm weather months.  
Warm water temperatures and water age are large contributors to the formation of THM's.
- Optimizing ozone pretreatment by updating control programming along with cleaning and inspection of the ozone generator. Ozone is a powerful oxidant that provides a level of disinfection along with a level of taste and odor control.

### Moving Forward (cont.)

- Currently finalizing the installation of granular activated carbon (GAC) to the filtration process, which should be complete by the end of July 2015. GAC will reduce THM's by removing the chemical precursors that react with chlorine to form the THM's.
- Increased water main flushing frequency in an effort to alleviate stagnant water, and reduce water age in the distribution system.
- Update of distribution system water hydraulic model, to determine possible problem areas.
- Repaired and replaced several large water main valves, which were inhibiting the designed flow of water through the system.
- Currently finalizing plans for the replacement of a large section of a 24' transmission water main in an area of concern in the distribution system. This project should be complete by the end of 2015.
- Currently completing a distribution system evaluation of 7000 water main valves that control the flow of water throughout the city. This project will be complete in July of 2015 and will provide information to guide decisions with further repairs and future projects.
- Currently working on several upgrades at the water treatment plant in preparation for KWA.

The City of Flint is dedicated to resolving the issues that are facing the water system, and will continue to make positive steps forward as we prepare for the future. The City would like to thank all the residents and customers for their patience and understanding as we face the challenges ahead. The trials and tribulations that we have faced with the switch to the Flint River as a source water will prove to be important as we move ahead as a member of the KWA. Many of the distribution system issues experienced while using the Flint River may have been experienced with any change in source water. As we continue to address the issues, take steps to be proactive, and the transition to the KWA pipeline, we can assure a future of quality drinking water in the City of Flint.

The following pages of this report include the results of 2014 regulatory testing. If you have any questions about this report or other water related concerns please contact the City of Flint Water Plant at 810-777-4577.

## 2014 Regulated Detected Contaminants

### Monitored at Treatment Plant

Inorganic & Organic Chemicals, Metals, and Pesticides						
Regulated Contaminant	Unit of Measure	MCLD	MCL	Highest Level Detected	Range of Detection	Violation
Inorganic Chemicals						
Fluoride	mg/L	4	4	0.88	0.12 - 0.88	No
Nitrate	mg/L	10	10	0.5	ND - 0.5	No
Metals						
Barium	mg/L	2	2	0.03	0.02 - 0.03	No
Selenium	mg/L	0.05	0.05	0.001	ND - 0.001	No
Pesticides						
Atrazine	mg/L	0.03	0.03	0.0003	ND - 0.0003	No
Organics						
Total Xylenes	mg/L	10	10	0.0005	ND - 0.0005	No

More than 100 other chemicals were monitored quarterly throughout the year that were not detected. The various classification groups of these chemicals include metals, carbamates, herbicides, pesticides, organics, and radiologicals.

Total Organic Carbon, TOC			
Regulated Contaminant	Required Monthly % Removal	Minimum Monthly % Removal	Monthly % Removal Ranges
Total Organic Carbon	50	53	53 - 68

Finished water and source water samples are collected and analyzed monthly to calculate percent removal. Total organic carbon includes numerous chemicals that are found naturally in surface waters. Certain chemicals found in this group are precursors to the disinfection byproducts trihalomethanes and haloacetic acids.

Turbidity			
Highest Single Measurement (Cannot exceed NTU)	Lowest Monthly % of Samples Meeting Turbidity Limit (0.3 NTU in 95% of samples)		Violation
0.22	100		No

Turbidity is a measure of the apparent cloudiness of water, usually attributed to particulate matter. The turbidity data in the chart above is measured from the water plant tap every 4 hours. Turbidity is monitored throughout each stage of the treatment process in 4 hour intervals. During a final stage of treatment, filtration, turbidity is monitored continuously with in-line meters, and verified every 4 hours in the laboratory.

In 2014, the EPA required the City of Flint and other communities to conduct further testing on unregulated contaminants. Samples were collected at the treatment plant and the maximum residence time location in the distribution system. The monitoring results will be utilized by the EPA to determine if these chemicals should be regulated. The unregulated contaminant monitoring that yielded results are presented in the chart below:

Unregulated Contaminant Monitoring			
Regulated Contaminant	Unit of Measure	Highest Level Detected	Range of Detection
Chromium	ug/L	0.40	ND - 0.4
Hexavalent Chromium	ug/L	0.40	0.34 - 0.40
Strontium	ug/L	130	120 - 130
Vanadium	ug/L	0.20	ND - 0.20

## 2014 Regulated Detected Contaminants Monitored in Distribution System

Disinfectant Residuals						
Regulated Contaminant	Unit of Measure	MCL	MCL	Highest Level Detected	Range of Detection	Violation
Total Chlorine Residual	mg/L	4.0	4.0	3.5	0.1 - 3.5	No

Microbiological Contaminants				
Regulated Contaminant	MCL	MCL	Highest Number detected (in 1 month)	Violation
Total Coliform bacteria	0	The presence of coliform bacteria in > 5% of monthly samples	15	Yes
<i>E. coli</i> Bacteria	0	0	1	Yes

Disinfectant residuals and microbiological contaminants are monitored at 8 locations throughout the city distribution system, and at the 2 drinking water reservoirs and pump stations located out in the distribution system. At least 100 samples are collected and analyzed each month.

Lead & Copper						
Regulated Contaminant	Unit of Measure	MCL	Action Level	90 <sup>th</sup> Percentile Value	Number of samples over AL	Violation
Lead	ug/L	0	15	6	2	No
Copper	mg/L	1.3	1.3	0.11	0	No

Lead and copper monitoring was conducted from June through December 2014 with the collection of 100 samples. Samples were collected by residents from the taps at their residence. Thank you to all who participated in collecting samples.

Disinfection By-Products						
Regulated Contaminant	Unit of Measure	MCL	MCL	Highest Level Detected	Range of Detection	Violation
Total Trihalomethanes (TTHM)	ug/L	n/a	80	196	33.3 - 196.2	Yes
Haloacetic Acids (HAA)	ug/L	n/a	60	64	5 - 64	No
Bromate	ug/L	10	10	23	ND - 23	No

Disinfection by-products occur as a result of the water treatment process. Bromate is formed as a result of using ozone as a treatment additive. Ozone is used to help control taste and odor issues, and as a pre-treatment disinfection. Naturally occurring bromide reacts with Ozone to generate bromate. Bromate is monitored monthly at the treatment plant, and compliance is based on a yearly average.

TTHM's and HAA's are formed as a result of utilizing chlorine in the treatment process. Naturally occurring compounds known as TOC's (total organic carbon) react with chlorine to form TTHM's and HAA's. The temperature and the age of water increase the formation of THM's and HAA's, and as a result, during the warm months of the year is when levels were at their highest. Samples are tested quarterly from 8 sites throughout the distribution system and compliance is based on a running annual average for each individual site.

## General Information (cont.)

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Infants and young children are typically more vulnerable to lead in drinking water than the general population. It is possible that the lead levels at your home may be higher than at other homes in the community as a result of materials used in your home's plumbing. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Flint Department of Utilities is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. If you are concerned about elevated lead levels in your home's water, you can minimize your potential exposure to lead in your water by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

## Current Drinking Water Issues

The City of Flint experienced drinking water issues in the summer of 2014. Issues began with areas of the city experiencing "rusty" water. This was largely due to the city distribution system, which contains hundreds of miles of cast iron pipe. As these pipes age and degrade, iron is released, causing the water to exhibit color. Other contributors to this issue include water main breaks and repairs, routine distribution system maintenance, and a source water change which exposed the pipes to a slightly different water chemistry.

The City of Flint received violations from the Michigan Department of Environmental Quality (MDEQ). A violations for total coliforms and *E. coli* in September, and a corresponding total trihalomethane (TTHM) violation in December. As routine sample site testing in the city distribution system began to detect bacteria, system flushing increased, and chlorine addition at the water treatment plant also increased. The resulting increased chlorine addition then resulted in the higher formation of THM's through the warm weather months.

While facing these issues, the City of Flint took steps to confer with industry professionals and state regulators in regards to treatment plant operation and distribution system operation. In the fall, as water temperatures dropped, and improvements were completed in the distribution system, THM levels were below the maximum contaminant level during routine November monitoring at 7 of the 8 monitoring sites.

## Moving Forward

The City of Flint has taken many steps to help correct the underlying issues that resulted in drinking water violations. Water treatment plant and distribution system corrective actions that were taken or are currently in progress include:

- Limiting the use of storage reservoirs during the warm weather months.  
Warm water temperatures and water age are large contributors to the formation of THM's.
- Optimizing ozone pretreatment by updating control programming along with cleaning and inspection of the ozone generators. Ozone is a powerful oxidant that provides a level of disinfection along with taste and odor control.

Key to the Detected Contaminant Tables		
Symbol	Abbreviation for	Definition/Explanation
>	Greater than	
AL	Action Level	The concentration of a contaminant, which, if exceeded, triggers treatment or other requirements which a water system must follow.
HAA5	Haloacetic Acids	HAA5 is the total of bromoacetic, chloroacetic, dibromoacetic, dichloroacetic, and trichloroacetic acids. Compliance is based on the total.
LRAA	Locational Running Annual Average	
MCL	Maximum Contaminant Level	The highest level of a contaminant that is allowed in water. MCLs are set as close to the MCLG's as feasible using the best available treatment technology.
MCLG	Maximum Contaminant Level Goal	The level of contaminant in drinking water below which there is no known or expected risk to health.
mg/L	Milligrams per Liter	A milligram = 1/1000 gram 1 milligram per liter is equal to 1ppm
MRDL	Maximum Residual Disinfectant Level	The highest level of disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
MRDLG	Maximum Residual Disinfectant Level Goal	The level of a drinking water disinfectant below which there is no known or expected risk to health. MRLDG's do not reflect the benefits of the use of disinfectants to control microbial contaminants.
n/a	Not Applicable	
ND	Not Detected	
NTU	Nephelometric Turbidity Units	Measures the cloudiness of water.
pCi/L	Picocuries per Liter	A measure of radioactivity. Picocurie (pCi) means the quantity of radioactive material producing 2.22 nuclear transformations per minute.
ppb	Parts Per Billion (one in one billion)	The ppb is equivalent to micrograms per liter. A microgram = 1/1000 milligram.
ppm	Parts Per Million (one in one million)	The ppm is equivalent to milligrams per liter. A milligram = 1/1000 gram.
RAA	Running Annual Average	
TT	Treatment Technique	A required process intended to reduce the level of a contaminant in drinking water.
TTHM	Total Trihalomethanes	Total Trihalomethanes is the sum of chloroform, bromodichloromethane, dibromochloromethane and bromoform. Compliance is based on total.
ug/L	Micrograms per Liter	A microgram = 1/1,000,000 gram 1 microgram per liter is equal to 1ppb

# Water Quality Update

The Michigan Department of Environmental Quality (MDEQ) has acknowledged our progress:

*"We are encouraged by the results from the most recent round of compliance samples collected on May 12, 2015, which again show individual TTHM levels all below the 0.020 mg/l standard at all locations throughout the City's system. Operations/Evaluation Reports from December 2014, February 2015, and May 2015 have identified possible causes and corrective measures for the previous elevated TTHM levels, which we encourage the City to continue implementing."*

-MDEQ

Notification is based on four quarters of test results. Because of last year's test results, for the City's annual quarterly testing average is not yet below the state's allowable average and the City is required to issue the attached notice (*"Important Information about Your Drinking Water"*). There is currently one testing site in the city that is still above the average due to the high levels it experienced in 2014:

Sample Location	5/21/2014	8/21/2014	11/21/2014	2/17/2015	5/19/2015	Long*
Water Treatment Plant Tap	56	66	93	8	28	41.8
1. 3719 Davison Rd. McDonalds	162.4	145.3	58.6	16.2	61.4	67.9
2. 822 S. Dort Hwy. BP Gas Station	75.1	31.2	36.2	19.9	46.1	53.6
3. 3302 S. Dort Hwy. Liquor Palace	111.6	127.2	33.3	16.8	63.5	60.2
4. 3606 Corunna Rd. Taco Bell	79.2	181.3	33.9	18.1	54.7	72
5. 2501 Flushing Rd. University Market	106.4	198.2	98.8	24.5	59.8	93.5
6. 3216 Martin Luther King Ave. Salem Housing	82.2	102.4	50.1	28.5	72.7	65.9
7. 5018 Clio Rd. After Aid	89.2	164.3	53.6	19.2	60.5	69.4
8. 6204 N. Saginaw St. North Flint Automotive	96.5	118.3	41.1	14.9	45.2	54.9

\* Long Running Annual Average

Average is below Acceptable Level (80ppm) at all but one site

If you have any questions about this report or would like a test done at your home, free of charge, please call us at 810-787-6537.

Maintaining safe water and improving its quality is a top priority for all of us at the City of Flint, and we apologize for the concerns these notices have raised. We have taken many steps to improve the safety and quality of our water supply and will be taking more. Every day work is being done to ensure a well maintained water system for all of our customers. Please track our progress on our website [cityofflint.com/public-works/water-quality-concerns/](http://cityofflint.com/public-works/water-quality-concerns/).

City of Flint

## IMPORTANT INFORMATION ABOUT YOUR DRINKING WATER

### City of Flint Did Not Meet Treatment Requirements

Our water system recently violated a drinking water standard. Although this incident was not an emergency, as our customers, you have a right to know what happened and what we are doing to correct this situation.

We routinely monitor for the presence of drinking water contaminants. Samples were collected for total trihalomethanes (TTHM) analysis from eight locations on a quarterly basis (August 21, November 20 of 2014, and February 17 & May 18 of 2015). The average of the results at ANY of the eight locations must not exceed the maximum contaminant level (MCL) for TTHMs, otherwise our water system exceeds the MCL. The standard for TTHMs is 80 micro grams per liter ( $\mu\text{g/L}$ ). The location reporting the highest TTHM level was 94  $\mu\text{g/L}$ ; thus, our water system exceeds the TTHM MCL.

#### What should I do?

- There is nothing you need to do unless you have a severely compromised immune system, have an infant, or are elderly. These people may be at increased risk and should seek advice about drinking water from their health care providers.
- You do not need to boil your water or take other corrective actions. If a situation arises where the water is no longer safe to drink, you will be notified within 24 hours.

#### What does this mean?

This is not an emergency. If it had been an emergency, you would have been notified within 24 hours.

*People who drink water containing trihalomethanes in excess of the MCL over many years may experience problems with their liver, kidneys, or central nervous system, and may have an increased risk of getting cancer.*

#### What is being done?

We are currently working on solutions to correct the problem. We anticipate resolving the problem in 2015. Our most recent individual sample results were all less than the 80  $\mu\text{g/L}$  standard, however since compliance is calculated using a locational running annual average (LRAA) of the most recent four quarters, we are still out of compliance with the MCL at one of eight locations.

For more information, please contact Mr. Brent Wright at 810-787-6537, or the Flint Water Plant at 4500 North Dort Highway, Flint, Michigan 48505.

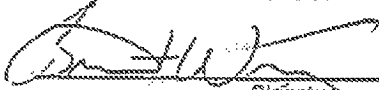

*Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.*

This notice is being sent to you by the City of Flint.

CERTIFICATION: F2/S3

WSSN: 02310

I certify that this water supply has fully complied with the public notification requirements in the Michigan Safe Drinking Water Act, 1976 PA 399, as amended, and the administrative rules.

Reminder to water supplier: This notice/certification must be sent to the Department of Environmental Quality.

## Wain Breaks from Leak Report

CITY OF FLINT  
OFFICE OF EMERGENCY MANAGER  
DARNELL EARLEY  
ICMA-CM, MPA

Jason Lorenz  
Public Information Officer  
(810) 237-2039  
jlorenz@cityofflint.com

**For Immediate Release**

**City of Flint Boil Water Advisory Still in Effect for Area Affected by  
Discovery of Abnormal Water Sample**

*Flint, Michigan – August 18, 2014* – The City of Flint's Utilities Department has received word today from the Department of Environmental Quality that the boil water advisory issued for a small portion of the city is still in effect although additional testing has shown no signs of E-coli or fecal coliform bacteria in the water. Testing over the last 48 hours has shown that the water tests negative for the presence of fecal coliform bacteria and E-coli, but an abnormal test result triggered the advisory. It is believed that a sampling error is to blame for the abnormal test; however, as a precaution, the advisory will remain in effect until the next citywide sampling has been completed. The next round of routine testing will take place on Tuesday, August 19, 2014 with the possibility that the advisory could be lifted as early as Wednesday, August 20, 2014.

Testing of the drinking water is a part of the routine process for ensuring the quality and safety of the system which happens weekly at nine different sites around the city. Drinking water contamination due to E-coli or coliform bacteria is very rare due to the fact that the bacteria cannot survive in the water for very long. The colder temperature

—CONTINUE—

CITY OF FLINT  
OFFICE OF EMERGENCY MANAGER  
DARNELL EARLEY  
ICMA-CM, MPA

of water in the system coupled with the regular blending of chlorine into the water makes for a hostile environment for these kinds of bacteria. The Flint Water Treatment Plant works diligently to provide water of the highest quality to everyone in the city.

jlorenz@cityofflint.com

**For Immediate Release**

**City of Flint Boil Water Advisory in Effect for Area Affected  
Due to Abnormal Water Sample**

*Flint, Michigan – September 5, 2014* – The City of Flint's Utilities Department in conjunction with the Department of Environmental Quality has issued a boil water advisory for a portion of the city. The boil water advisory is in effect for the area bordered by Dayton Street on the north, DuPont Street on the east, the Flint River on the south, and by Lavelle Road (to the Flint River) on the west. Testing over the last 48 hours has shown that the water in the area above tests positive for the presence of total coliform bacteria. Residents in the area should continue to boil water or use bottled water for drinking, bathing, making ice, brushing teeth, washing dishes, and preparing food until further notice. Boiling the water kills bacteria or other harmful organisms.

Total coliform bacteria are generally not harmful themselves. Coliforms are bacteria which are naturally present in the environment and are used as an indicator that other, potentially-harmful, bacteria *may be present*. Usually, coliforms are a sign that there could be a problem with the treatment or distribution system (pipes).

–CONTINUE–

CITY OF FLINT  
OFFICE OF EMERGENCY MANAGER  
DARNELL EARLEY  
ICMA-CM, MPA

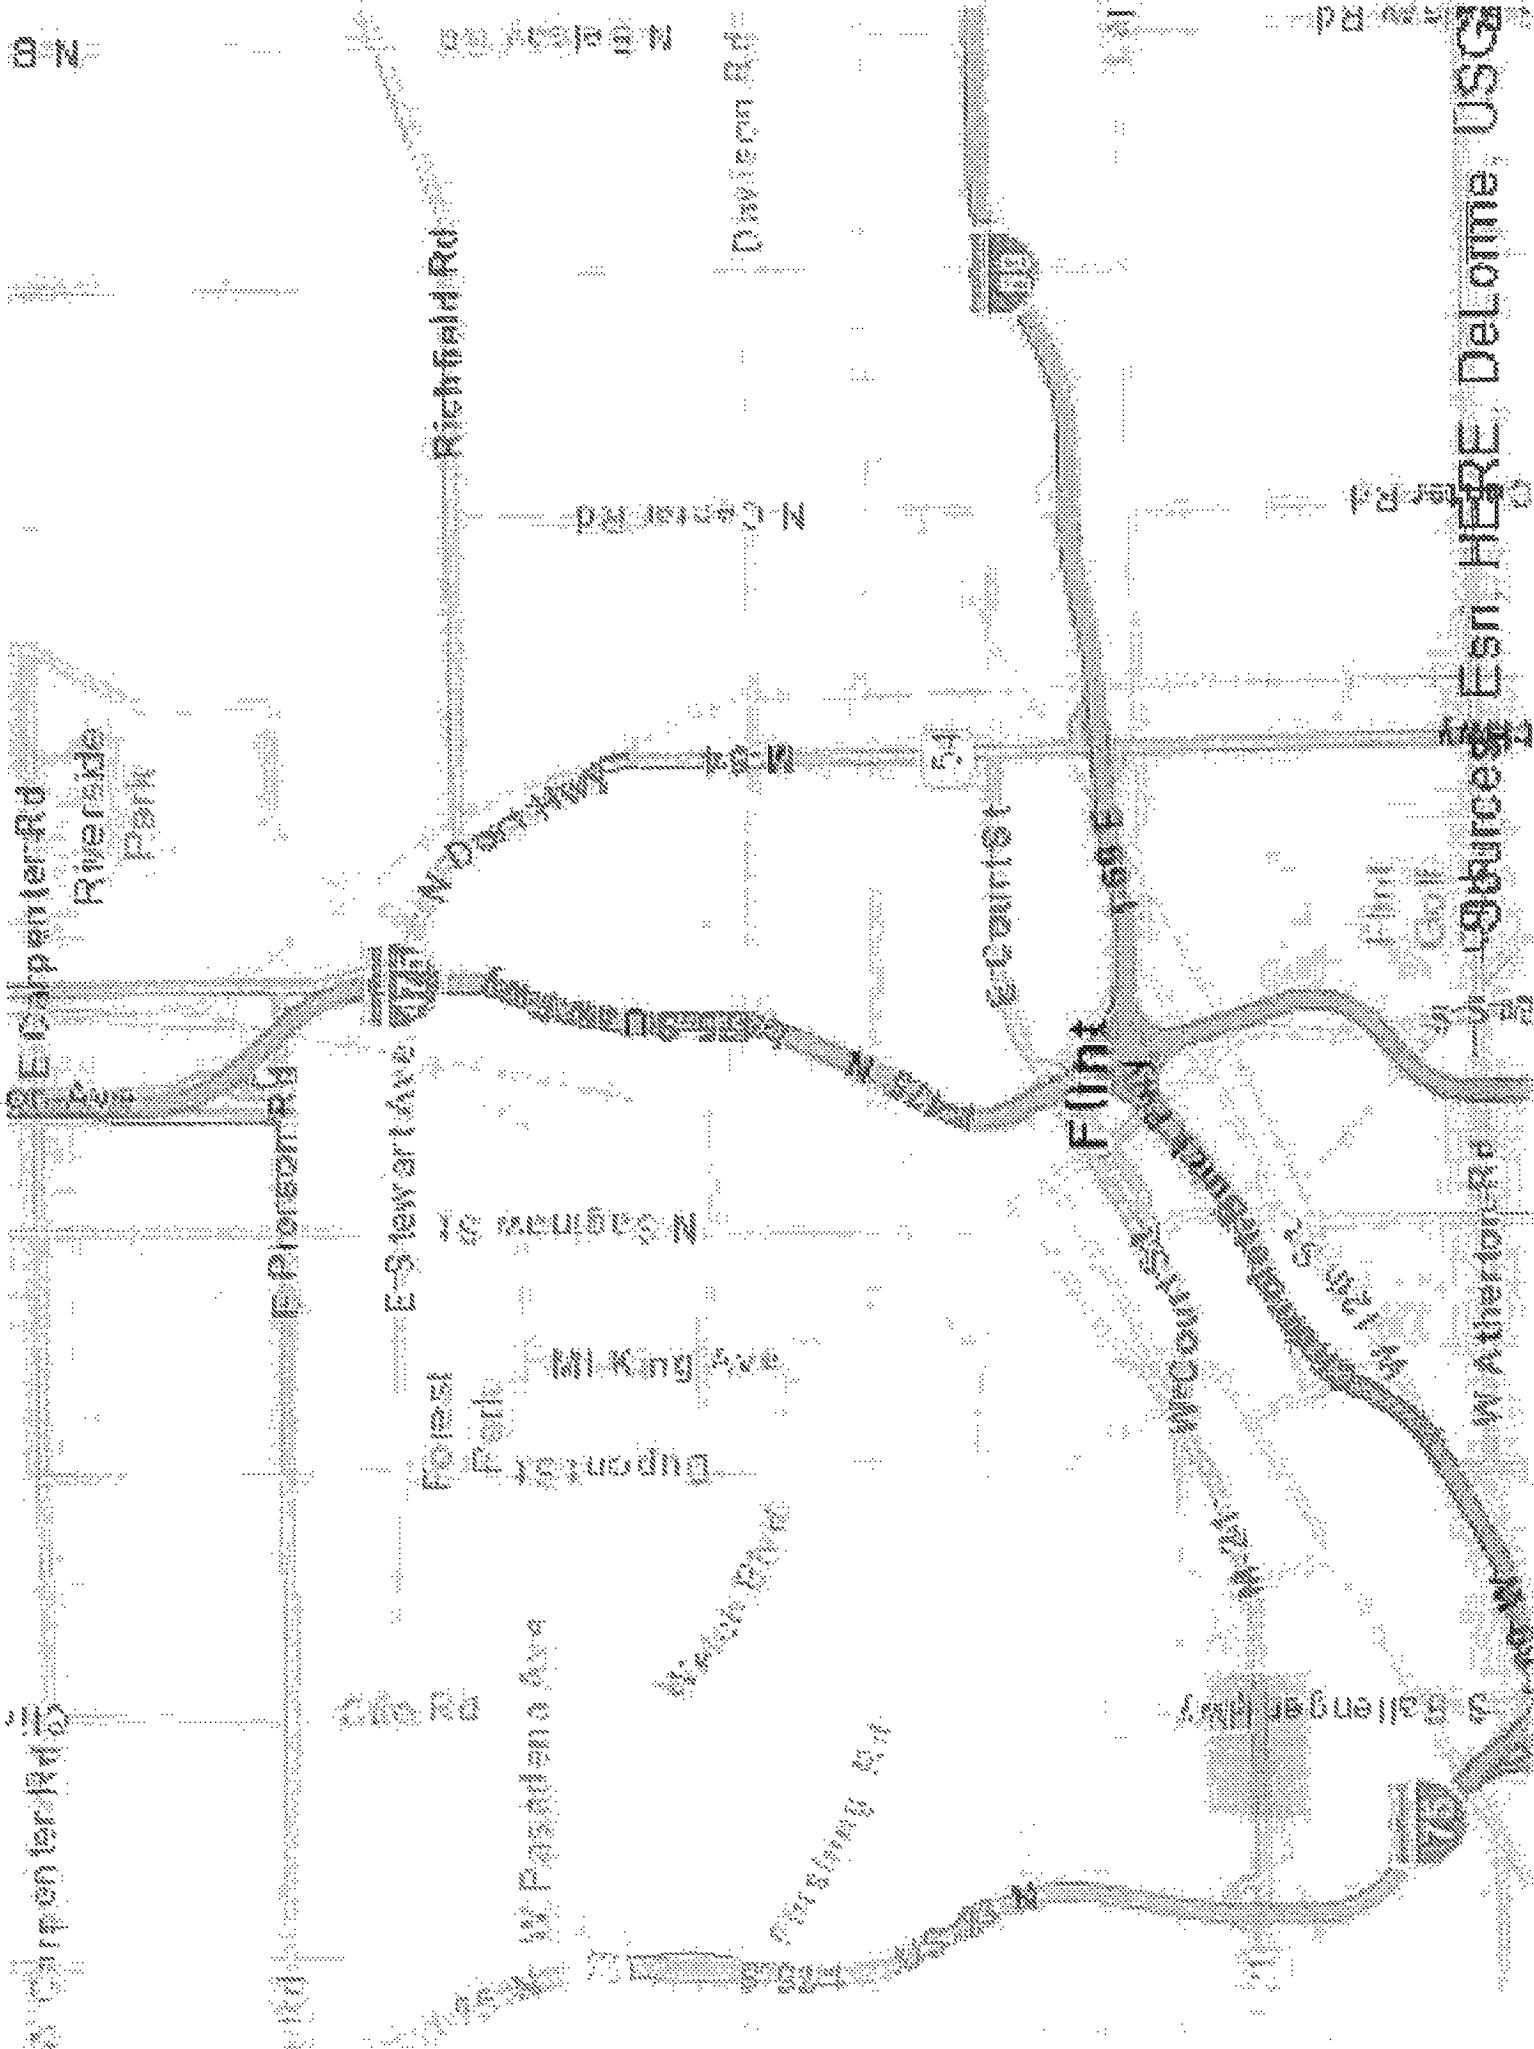

Whenever we detect coliform bacteria in any sample, we do follow-up testing to see if other bacteria of greater concern, such as fecal coliform or E. coli, are present. We did not find any of these bacteria in our subsequent testing. If we had, we would have notified you immediately. However, we are still finding coliforms in the drinking water.

The City of Flint Utilities Department will be flushing the system in that part of the city and increasing the chlorine added to water in the area. The City anticipates that the problem will be resolved within the next three days, which is the minimum amount of time for a boil water notice. All water testing results at the City of Flint Water Treatment Plant have shown the City's drinking water meets all Safe Water Drinking Standards. Testing of the drinking water is a part of the routine process for ensuring the quality and safety of the system which happens weekly at ten different sites around the city. Anyone with questions about the advisory or any other water issues should call 810-787-6537.

—END—

		Policy Title: Water Management Including Legionella Prevention	
Effective Date: 2/01		Oversight Level: Level 2	Policy No: EG-101
Review Dates: 12/16			
Revised: 12/04, 4/07, 11/10, 5/14, 12/14			
McLaren Flint Business Unit: Engineering		Functional Responsibility for the Policy: Engineering Department	

- Objective:** To ensure safe water management for McLaren Flint
- Scope:** All departments, units, clinics and facilities under the direction of McLaren Flint
- Definitions:** McLaren Flint shall provide a potable water supply for drinking, food preparation, hand washing, and personal hygiene for patients, visitors, and employees.
- Provisions:**
- A. When potable (drinking) water is not available, a potable supply will be furnished. Engineering shall establish sources for potable water per policy and arrange for supplies in times of water interruption (See Engineering Procedure Manual).
  - B. If there is a break in the water system to the facility, the municipal water supplier is responsible for testing the water. As a precaution, a copy of the city's report shall be obtained and reviewed by engineering to confirm results.
  - C. If there is a potential internal or external contamination of the water system within the facility and the need for testing is evident, water samples shall be collected by a third-party consultant and sent to a licensed laboratory for analysis.
  - D. All construction areas with new plumbing fixtures shall have water samples collected by a third-party consultant and sent to a licensed laboratory for analysis prior to use.
  - E. If a disruption of service is planned or occurs spontaneously, Engineering shall notify Infection Control and the managers of the affected area, establish a potable water source, and conduct water testing if required. The Infection Preventionist, along with area managers, shall notify and educate staff, patients, and visitors as to the source and use of the temporary potable water supply.
  - F. Only potable water can be used for drinking, food preparation, handwashing, and personal hygiene. In the event of a water shortage or disruption in service, an alcohol-based hand rinse may be used temporarily until access to a potable water source has been established. Alcohol-based hand rinses shall not replace hand washing on a permanent basis.
  - G. Anti-siphon valves shall be installed on faucets used for dialysis to prevent backflow and contamination during use.

		Policy Title: Water Supply Failure (Code W)	
Effective Date: 4/2015	Reviewed:  Revised:	Oversight Level: Level 2	Policy No: EG-105
McLaren Flint Business Unit: Engineering Department		Functional Responsibility for the Policy: Director of Engineering	

**Objective:** McLaren Flint Hospital campus will be able to prepare for, respond to, and recover from a total or partial interruption of McLaren Flint's normal water supply.

**Scope:** This policy applies to McLaren Flint Hospital, the adjacent outpatient sites and all immediate grounds.

**Policy:** A water supply failure can be categorized as one of multiple types of system disruptions:

1. Visibly Discolored Water
2. Water Boil Advisory
3. Scheduled Interruption of Water Supply
4. Emergency Loss of Water Supply

#### Visibly Discolored Water

Visibly discolored water can be defined when the appearance of potable water, specifically, is iron-tinted and/or yellow in color. There are two major sources that can cause water to be discolored — flow changes in the municipal distribution system caused by a main leak, valve failure or an open fire hydrant, and/or a flow change to the internal water system of the building. Discolored water is not a health threat even though it is not very appealing to drink. Even very low levels of iron can color the water.

1. Engineering Services shall recommend the affected area run water continuously (or flush) for a minimum of five (5) minutes or until it clears of the discoloration. If water does not clear within five (5) minutes contact Engineering Services via a work order using AIMS, the Computerized Maintenance Management System (CMMS).
2. In the event that the five (5) minute flush is not successful, Engineering Services will investigate the cause of the discoloration, which may include contacting the City of Flint or appropriate municipality to determine if discoloration is externally caused.
3. Based on information gathered from the municipality or knowledge of the source, Engineering Services will determine if a Code W shall be announced.

#### Boil-Water Advisory

A boil-water advisory or boil-water order is a public health advisory or directive given by government or health authorities to consumers when a community's drinking water is, or could be, contaminated by pathogens.

1. Boil Advisory notification received from the City of Flint, Flint Township, Genesee County Health Department or another governmental agency, such as the EPA.

2. Engineering Services is to establish and maintain direct contact with the governmental agency to determine location/boundaries of the advisory, estimate the duration of the advisory and provide a status report.
3. Engineering Services shall direct a Code W to be announced over head, with duration and details, if known.
4. Communications will immediately begin notification of critical departments by direct phone call and shall document the contact. (see Attachment A)
5. The Incident Commander and/or Nursing Supervisor with Administration shall determine if the HIC (Hospital Incident Command) is needed for communication management purposes. If so a Code Triage alert shall be announced overhead and paged to all HIC.
6. Engineering Services will shut off the water source to ice machines and drinking fountains, following the Engineering Services Ice Machine policy. The remaining ice in the ice machines shall not be used for human consumption. The ice may be utilized within ice packs. Signs shall be posted indicating the inability to use these units.
7. Distribution of potable water and the appropriate dispensing apparatus to departments for drinking purposes and hand-washing shall be conducted by Engineering Services.
8. Departmental-specific procedures including alternate hand washing protocols are instituted.
9. The sanitary sewer system (toilets, urinals and drains) may still be used.
10. All affected departments shall enact departmental-specific water conservation procedures. If deemed necessary, Engineering Services shall enact the "Extreme Conservation Procedures" of the Disaster Internal/External Engineering policy.

#### Scheduled Interruption of Water Supply

A scheduled interruption of water supply includes a total loss or reduced volume of the municipal water supply. The loss may be internally created or by a municipality. Prior notice will be given to all areas affected.

1. All attempts will be made to provide a minimum of 48 hour notice to the affected areas or buildings.
2. Engineering Services is to establish and maintain direct contact with the governmental agency to determine the area affected and estimate the duration of the interruption and provide status reports as necessary.
3. Administration and Engineering shall determine if the HIC (Hospital Incident Command) is necessary for communication management. If so the HCC will be set up ahead of the scheduled interruption.
4. Distribution of potable water and the appropriate dispensing apparatus to departments for drinking purposes and hand-washing shall be conducted by Engineering Services.
5. Engineering services will contact the bottled water supplier to increase the bottled potable water supply and dispensing apparatus available for drinking use and hand washing prior to the interruption to maintain a minimum of fifty (50) 5-gallon bottles at the hospital during the water interruption.

6. Engineering Services will shut off the water source to ice machines and drinking fountains, following the Engineering Services Ice Machine policy. The remaining ice in the ice machines may be dispensed and used. Signs shall be posted indicating the inability to use these units once the ice has been completely dispensed.
7. All affected departments shall enact departmental-specific water conservation procedures. If deemed necessary, Engineering Services shall enact the "Extreme Conservation Procedures" of the Disaster Internal/External Engineering policy.
8. If water shut down duration is anticipated to be greater than four (4) hours, Engineering Services will contract to provide portable sanitary toilets for staff and visitor use.
9. The sanitary sewer system (toilets, urinals and drains) may not be used.
10. Code W shall be announced overhead with duration and details.
11. Engineering Services shall update a Code W status report every hour to staff via an overhead page.
12. Engineering Services shall contact the State of Michigan Fire Marshal.
13. Engineering Services will institute a fire watch for affected areas.
14. In the event of a prolonged interruption or unforeseen emergency Administration shall initiate a code triage alert.

#### Emergency Loss of Water Supply

An emergency loss of water supply includes a total loss or reduced municipal water supply, with no prior notice. The loss may be internally created or by a municipality.

1. Engineering Services is to establish and maintain direct contact with the governmental agency to determine the area affected and estimate the duration of the interruption and provide status reports as necessary.
2. Engineering Services shall contact the State of Michigan Fire Marshal.
3. Engineering Services will institute a fire watch for affected areas.
4. All affected departments shall enact the departmental-specific water conservation procedures. If deemed necessary, Engineering Services shall enact the "Extreme Conservation Procedures" of the Disaster Internal/External Engineering policy.
5. Administration and Engineering shall determine if the HIC (Hospital Incident Command) is necessary for communication management. If so a code triage alert will be announced.
6. Code W shall be announced overhead with duration and details.
7. Engineering Services shall update a Code W status report every hour to staff via an overhead page.
8. Communications will immediately begin notification of critical departments by direct phone call and shall document the contact. (see Attachment A)
9. All affected departments shall enact the departmental-specific water conservation procedures. If deemed necessary, Engineering Services shall enact the "Extreme

Condition Conservation" procedures of the Disaster Internal/External Engineering policy.

10. Distribution of potable water and the appropriate dispensing apparatus to departments for drinking purposes and hand-washing shall be conducted by Engineering Services.
11. Engineering services will contact the bottled water supplier to supplement the potable water supply and dispensing apparatus available for drinking use to maintain a minimum of fifty (50) 5-gallon bottles at the hospital.
12. Engineering Services will shut off the water source to ice machines and drinking fountains, following the Engineering Services Ice Machine policy. The remaining ice in the ice machines may be dispensed and used. Signs shall be posted indicating the inability to use these units once the ice has been completely dispensed.
13. If water shut down duration is anticipated to be greater than four (4) hours, Engineering Services will contract to provide portable sanitary toilets for staff and visitor use.
14. The sanitary sewer system (toilets, urinals and drains) may not be used.

**Definitions:**

Boil-water advisory: a public health advisory or directive given by government or health authorities to consumers when a community's drinking water is, or could be, contaminated by pathogens

Code W: a water supply failure/interruption

Emergency loss of water supply: a total loss or reduced municipal water supply, with no prior notice. The loss may be internally created or by a municipality.

Fire Watch: a person or persons assigned to an area for the purpose of protecting the occupants from fire or similar emergencies. (NFPA 101, *Life Safety Code*, §3.3.77, 2000 edition)

Municipal Water: water originating from a ground or surface water source (raw water) which is purified through a treatment process, stored and distributed using a distribution system network of pumping stations and underground piping to the user.

Potable water: water suitable for drinking and hand washing.

Scheduled interruption of water supply: a total loss or reduced municipal water supply. The loss may be internally created or by a municipality. Prior notice will be given to all areas affected.

Visibly discolored water: when the appearance of potable water, specifically, is iron-tinted and/or yellow in color. There are two major sources that can cause water to be discolored - flow changes in the municipal distribution system caused by a main leak, valve failure or an open fire hydrant, and/or a flow change to the internal water system of the building.

Discolored water is not a health threat even though it is not very appealing to drink. Even very low levels of iron can color the water.

**Provisions:**

The City of Flint provides municipal water and monitors the quality of water provided to McLaren Flint Hospital, Ballenger MRI, Surgery and Endoscopy Center, McLaren Imaging Center, Barbara Ann Karmanos-McLaren Flint Cancer Center and Proton Beam.

Flint Township provides municipal water to Medical Education, Beech Hill Centre, McLaren

Corporate Offices, McLaren Health Plan, and the McLaren Hospitality House.

250 gallons of potable water are stored on site and stock is checked periodically.

**Administrative Responsibility:** McLaren Flint Director of Engineering has overall administrative responsibility for this policy.

**Exception Provisions:** McLaren Flint Incident Commander, State of Michigan Fire Marshal, McLaren Flint Director of Engineering, Vice President of Ancillary and Support Services and/or Chief Executive Officer may supersede any or all of the above noted directives with expressed written documentation.

**References or Appendices:** Extreme Condition Conservation procedures, Disaster Internal/External policy

## 1. PURPOSE

The purpose of this guideline is to provide information and guidance in order to minimize *Legionella* contamination in building water systems.

## 2. SCOPE

2.1 This guideline provides specific environmental and operational guidelines that will contribute to the safe operation of building water systems to minimize the risk of contamination of *Legionella*.

2.2 This guideline is intended for use with nonresidential building systems (including but not limited to hotels, office buildings, hospitals and other health care facilities, assisted living facilities, schools and universities, commercial buildings, industrial buildings, etc.) and centralized systems in residentially redeveloped buildings (including but not limited to central heating/cooling systems, central domestic water systems, common area showers, etc.). While not specifically intended for nonresidential or single-family residential building systems, some of the information may be useful for these systems.

2.3 This guideline is intended for the use of designers, installers, owners, operators, users, maintenance personnel, and equipment manufacturers.

## 3. ECOLOGY OF *LEGIONELLA*

### 3.1 Infection and Disease

The majority of *Legionnaires' disease* cases diagnosed and reported to the public health officials are sporadic (i.e., not occurring as part of a recognized outbreak). Compared with outbreak-associated infection, much less is known about transmission of sporadic *Legionnaires' disease*, although it is likely that transmission occurs by similar mechanisms. Exposure to *Legionella* in sporadic cases may occur in a variety of settings, including the home, the workplace, and public places visited during routine daily activities or during travel. The proportion of sporadic disease attributable to exposure in each of these settings and to various environmental sources is unknown.

*Legionnaires' disease* is bacterial. When *Legionella* are present in aquatic environments, the risk of transmission of infection to humans depends on the presence of several factors: conditions favorable for amplification of the organism; a mechanism of dissemination (e.g., aerosolization of colonized water); invasion of the organism in a site where it is capable of causing infection; bacterial strain-specific virulence factors; and the susceptibility of the host. Over 40 species of *Legionella* have been identified. *L. pneumophila* appears to be the most virulent and is associated with approximately 90% of cases of *Legionnaires' disease*. Most *L. pneumophila* infections are caused by serogroup 1; however, certain serogroup 1 strains may be more virulent. The risk of acquiring *Legionnaires' disease* is greater for older persons and for those who smoke tobacco or have chronic lung disease. Persons whose immune systems are suppressed by certain drugs or by underlying medical conditions appear to be at particularly high risk.

## 3.2 Habitat

*Legionella* bacteria are commonly present in natural and man-made aquatic environments. The organism is occasionally found in other sources, such as mud from streams and ponding water; however, the overall importance of nonaqueous environmental sources in human disease is not yet known. In natural water sources and municipal water systems, *Legionella* are generally present in very low or undetectable concentrations. However, under certain circumstances within man-made water systems, the concentrations of organisms may increase markedly, a process termed "amplification." Conditions that are favorable for the amplification of *Legionella* growth include water temperatures of 25–42°C (77–108°F), stagnation, scale and sediment, biofilms, and the presence of amoebae. *Legionella* infect and multiply within several species of free-living amoebae, as well as ciliated protozoa. The initial site of infection in humans with *Legionnaires' disease* is the pulmonary macrophage. These cells engulf *Legionella*, provide an intracellular environment that is reasonably similar to that within host protozoa, and allow for multiplication of the bacterium. Hence, *Legionella* may be considered *opportunistic*; i.e., they naturally infect free-living amoebae and incidentally infect the phagocytic cells within human lungs under certain circumstances. Although *Legionella* may be cultivated on special agar media in laboratory settings, growth in the absence of protozoa *in vitro* is the absence of complex microbial biofilms has not been demonstrated. Intracellular growth of *Legionella* within protozoa and within diverse microbial biofilms may be the primary means of proliferation.

There is an indication that growth of *Legionella* is influenced by certain materials. Marine rubbers, wood, and some plastics have been shown to support the amplification of *Legionella*, while other materials such as copper inhibit their growth.

Generally, *Legionella* thrive in diverse, complex microbial environments because they require nutrients and protection from the environment. Controlling the populations of protozoa and other microorganisms may be the best means of minimizing *Legionella*.

### 3.3 Transmission of *Legionnaires' Disease*

Most data on the transmission of *Legionnaires' disease* are derived from investigations of disease outbreaks. These data suggest that, in most instances, transmission to humans occurs when water containing the organism is aerosolized in respirable droplets (1–5 micrometers in diameter) and inhaled by a susceptible host.

Prior to actual disease a number of events occur, some of which can be influenced by good engineering and maintenance practices. These events and environmental opportunities are outlined in Figure 1. The first event, survival in water, is generally outside the scope of building engineering and management practices. The next three events—amplification, dissemination, and transmission—can be influenced by engineering design and maintenance practices. Subsequent events are influenced by the individual's health.

The most effective control for most diseases, including *Legionnaires' disease*, is prevention of transmission at as many points

Legionella Transmission

Figure 1. Legionella transmission. Adapted from Barthelemy (1997).

as possible in the disease's chain of transmission. The rationale for this is that if one preventive measure fails, others will be in place and act as fail-safe mechanisms. With this philosophy in mind, it may be desirable to design interventions to prevent transmission of Legionella at as many points as possible in the disease's chain of transmission. General concepts are presented so that readers may develop an understanding of the types of conditions that may allow simplification and transmission of Legionella.

A variety of aerosol-producing devices have been associated with outbreaks of Legionnaires' disease, including cooling towers,<sup>2,3</sup> evaporative coolers,<sup>4,5</sup> showers,<sup>6,7</sup> whirlpools,<sup>8,9</sup> humidifiers,<sup>10</sup> decorative fountains,<sup>11,12</sup> and a grocery store produce cooler.<sup>13</sup> Aspirations of colonized drinking water into the lungs has been suggested as the mode of transmission in some cases of hospital-acquired Legionnaires' disease.<sup>14-18</sup>

Numerous investigations have demonstrated that cooling towers and evaporative coolers have served as the sources of Legionella-contaminated aerosols causing outbreaks of community- and hospital-acquired infection. Outbreak-associated transmission via cooling towers and evaporative coolers has been most commonly documented when these infected have been in close proximity to the contaminated devices. However, data from a few Legionnaires' disease outbreaks investigations suggest that Legionella may be carried in cooling tower aerosols for distances of up to 3 kilometers (2 miles).<sup>19</sup> (This is regarded as requiring an unusual combination of climatic conditions). A number of outbreaks of Legionnaires' disease associated with cooling towers and evaporative coolers have occurred after these devices have been restarted following a period of inactivity.<sup>20,21</sup>

Shower heads and tap faucets can produce aerosols containing Legionella in droplets of respirable size. Epidemiologic studies and air sampling conducted during outbreaks in restaurants have established the role of aerosols produced by showers and tap faucets in disease transmission.<sup>9</sup> Aerosols

produced by respiratory therapy equipment that have been filled or rinsed with contaminated potable water in hospitals have also caused disease transmission.<sup>12,22</sup>

Heated spa pools operate at temperatures conducive to bacterial growth. The addition of spa pools can result in formation of potentially contaminated aerosols. A range of pathogenic microorganisms, including *Pseudomonas aeruginosa* and *L. pneumophila*, have been found in spa pools. Outbreaks of Legionnaires' disease have occurred among bathers as well as people near chlorinated spas.<sup>10,23</sup>

A more complete and detailed description of the most common amplifiers associated with building water systems, including the treatment recommended to minimize the risk of Legionellosis, is found in Sections 4-10.

#### 4. POTABLE AND EMERGENCY WATER SYSTEMS

##### 4.1 Potable Water Systems

4.1.1 System Description. Potable water systems in buildings for this discussion start at the point where the water enters the building and end where it exits the piping as a faucet, showerhead, etc. The systems include all piping, hot water heaters, storage tanks, faucets, nozzles, and other distribution outlets.

4.1.2 System Operation. Factors associated with the plumbing system that may influence the growth of Legionella are as follows:

4.1.2.1 Multiple Possible Water Supplies. Multiple possible water supplies are generally attempted to control the presence of microorganisms, individually, to control microbes associated with sewage. The Legionella are more tolerant of chlorine than many other bacteria and may be present in small numbers in municipal water supplies.<sup>24</sup>

4.1.2.2 Temperature. Although Legionella have been recovered from cold water, the temperature range favorable for amplification is 7.5-42°C (77-108°F). The environmental temperature range at the temperature is moved from this range.

4.1.2.3 Distribution System. Growth of Legionella may occur in portions of the system with infrequent use, in stagnant water, and in portions of the system with rapid temperatures. Growth may also occur in dead-end lines, attached hoses, shower nozzles, tap faucets, hot water tanks, and aerators.

4.1.2.4 Distribution Methods. Rubber washers and fittings, including water meter assemblies and rubber hoses with spray attachments, have been shown to provide sites for growth of Legionella.<sup>24</sup> Organic compounds leached from plumbing materials may contribute to growth of heterotrophic bacteria, including Legionella.

4.1.3 Water Droplet Size. Communicated potable water sources present the greatest risk when dispersed into the air in a very small droplet size (less than 5 micrometers) that can be inhaled deeply into the lungs. Aerosols that may generate small droplets are those that break up the water column, i.e., shower nozzles, aerators, spray nozzles, water impacting on hard surfaces, and bubbles breaking up.

4.1.4 Materials. Both dead and living microorganisms, biofilms, and debris may provide nutrient sources for Legionella growth. When Legionella are found in plumbing systems, it is common to detect the microbes in the sediment

in hot water tanks and in peripheral plumbing fixtures that accumulate sediment. Legionella growth appears to be heaviest on the solid liquid interface with the development of slime deposits.

4.1.5 Associated Cases of Legionnaires' Disease. Potable water systems are an important potential source of Legionella in all buildings and are of particular importance in hospitals, nursing homes, and other health care facilities.<sup>25</sup> Many reports link Legionella in hospital tap water to epidemics and clusters of nonfatal (disseminated) infections.<sup>26</sup> Legionnaires' disease, often involving immunocompromised patients.<sup>26</sup>

4.1.6 Recommended Treatment. Where provided in health care facilities, nursing homes, and other high-risk facilities, cold water should be stored and distributed at temperatures below 20°C (68°F), while hot water should be stored above 60°C (140°F) and circulated with a minimum return temperature of 51°C (124°F). However, great care should be taken to avoid scalding problems. One method is to install pressure thermostatic mixing valves. Where buildings cannot be retrofitted, periodically increasing the temperature to at least 60°C (139°F) or chlorination followed by flushing should be considered. Systems should be inspected annually to ensure that thermostats are functioning properly.

Where provided in other situations, hot water should be stored at temperatures of 49°C (120°F) or above.

These hot or cold water systems that incorporate an elevated holding tank should be inspected and cleaned annually. Lids should fit closely to exclude foreign materials.

Detailed current plans for hot and cold water piping systems should be readily available. Hot water heaters and storage vessels for such systems should have a drainage facility at the lowest point, and the heating element should be located as close as possible to the bottom of the vessel to facilitate rinsing and prevent water temperature stratification. In high-risk applications, isolated recirculation loops should be incorporated as a design feature. For all situations, the pipe runs should be as short as practical. Moreover, where recirculation is employed, the pipe runs should be insulated and long dead legs avoided. New shower systems in large buildings, hospitals, and nursing homes should be designed to permit rinsing of hot and cold water near the showerhead. The warm water section of pipe between the control valve and showerhead should be self-draining.

Copper-silver ionization is a relatively new approach to controlling Legionella in hot water distribution systems and has been used successfully in a number of hospitals.<sup>27-29</sup> Electrically generated copper and silver ions build up in the hot water recirculating system to levels of 0.2-0.8 mg/L copper and 0.03-0.09 mg/L silver. The optimal concentration of copper-silver ionization may not be universally effective because of variability in water quality and system design. It is also important to note that the efficacy of copper-silver ion, like chlorine, is adversely affected by elevated pH.<sup>30</sup>

Where disinfection of hot water systems is necessary (typically due to biofilm of an outbreak of Legionnaires'), the hot water temperature should be raised to 71-77°C (160-170°F) and maintained at that level while progressively flushing each outlet around the system. A disinfection flush rate of five minutes has been recommended by the Center for Disease Control, Hospital Infection Control Practices Advisory Committee.<sup>31</sup> However, the optimal flush time is not known and longer flush times may be necessary. In the original report describing this method, multiple 30-minute flushes were required to significantly reduce Legionella contamination.<sup>31</sup> The number of outlets that can be flushed simultaneously will depend on the capacity of the water heater and the flow capability of the system. Local building and sanitary codes should be checked for any temperature limits of water discharged to the street. Appropriate safety procedures to prevent scalding are essential. When possible, flushing should be performed when the fewest building occupants are present (e.g., nights and weekends). For systems where demand shock treatment is not possible, shock chlorination may provide an alternative.<sup>32,33</sup> However, there is less experience with this method of disinfection. Also, users should realize that the required levels of free chlorine residual can cause corrosion of metals. Chlorine should be added to achieve a free chlorine residual of at least 2 mg/L throughout the system. This may require chlorination of the water heater or tank to levels of 20 to 30 mg/L. The pH of the water should be maintained between 7.8 and 8.0. Each outlet should be flushed until the color of chlorine is detected. The chlorine should remain in the system for a minimum of 7 hours (not to exceed 24 hours), after which the system should be thoroughly flushed.

Once the disinfection is complete, recirculation is likely to occur unless the proper temperatures are maintained, continuous supplemental chlorination is continued, or alternative approaches, such as the use of a silver-copper ionization device, are employed.

In high-risk applications, monthly removal of shower heads and tap aerators to clean out sediment and scale and to clean them in a chlorine bleach solution is recommended. For potable water systems that were opened for repair or other construction or systems that were subjected to water pressure changes associated with construction (which may cause water to become brown and the concentration of Legionella to dramatically increase),<sup>34</sup> it is recommended that at a minimum the system be thoroughly flushed. High-temperature flushing or chlorination may be appropriate, and the judgement should be made on a job-specific basis. If only a portion of the system is involved, high-temperature flushing or chlorination may be used on only that portion of the system.

4.2 Emergency Water Systems—Safety Showers, Eye Wash Stations, and Fire Suppression Systems

4.2.1 System Description. All three of these systems are generally plumbed to the potable water system, have little or no flow with resulting stagnant conditions, and may reach temperatures warmer than ambient. Legionella, heterotrophic bacteria, and amoebae have been cultured from these systems.<sup>35</sup> When the devices are used, aerocirculation is expected.

4.2.2 Emergency Water Systems—Safety Showers, Eye Wash Stations, and Fire Suppression Systems

4.2.3 System Description. All three of these systems are generally plumbed to the potable water system, have little or no flow with resulting stagnant conditions, and may reach temperatures warmer than ambient. Legionella, heterotrophic bacteria, and amoebae have been cultured from these systems.<sup>35</sup> When the devices are used, aerocirculation is expected.

4.3.2. Associated Cases of Legionnaires' Disease. Cases of Legionnaires' disease resulting from exposure to these waters have not been documented.

4.4.3. Recommended Treatment. Safety shower and eye wash stations should be flushed at least monthly. In the case of the pretank system, it is recommended that fire-fighting personnel wear protective respiratory gear and that non-fire-fighting personnel wear eye protection. Appropriate personnel should be taken when checking the operation of the sprayer system.

## 5. HEATED SPAS

### 5.1 System Description

Heated spas are small baths or pools used for relaxation (i.e., recreational), hygienic, or therapeutic purposes. Common features include warm water temperatures (120-140°F/49-61°C) and the constant recirculation and aeration of the water through high-velocity jets and/or injection of air. While there is some confusion over the terms used for each, the differences among the types of baths and pools are related mainly to size, purpose, material work and equipment.

5.1.1. Whirlpool Spa (Hot Tub, Hydrotherapy Pool). These are recreational baths or pools (jetted or private) holding more than one person and filled with warm recirculating water. The water is not replaced after each use but rather is filtered to remove particulates and chemically treated typically with chlorine or bromine to provide microbiological control. They may be located indoors or outdoors. Most smaller units are made from molded fiberglass, while larger in-ground varieties are generally made of galvanized steel with a white plastic finish. They are generally circular in shape, always shallow (less than 1.5 m/5 ft), and contain enough water to allow occupants to submerge up to the chest or neck.

5.1.2. Hot Tub. These are traditionally deeper hot water baths or pools made of wood, fiberglass, white oak, pine, or teak. Otherwise, the features and uses are similar to spas.

5.1.3. Whirlpool. This terminology has been traditionally used for the small therapeutic pools (often used in clinics) filled with warm, vigorously moving water, which may be used enough for treatment of a specific joint, such as a knee, ankle, or elbow. These pools are generally made of stainless steel and are equipped between uses.

5.1.4. Whirlpool Bath. These are small baths often found in bedrooms of hotel rooms or private residences. As such, they are used for both recreational and hygienic purposes. The baths are filled with high-velocity water jets under an injection, but unlike whirlpool spas and hot tubs, the water is replaced after each use.

### 5.2 System Operation

**Recommendation:** The water temperature in these spas, baths, and pools is generally in the range of 37-40°C (99-104°F), with the maximum temperature based on bath comfort. These warm temperatures are close to the optimum for the multiplication of *Legionella* and many other microorganisms. The water temperatures also accelerate the loss of the biofilm.

**Aerated Distribution.** Due to the operational features of the high-velocity water recirculation and air injection, a large number of bubbles of varying sizes rise to the water surface and burst. Microorganisms (e.g., *Legionella*) in the water can be released into the air via either bubbles or aerosol mist.

### 5.3 Water Treatment

This system uses hot water droplets of varying sizes (from 1 to 3 micrometers) and extends into the air to a height of at least 0.5 meters (1 ft) above the water surface (well within the breathing zone of the bathers). Under conditions of high relative humidity and air currents, the aerosol may also expose individuals outside the spa.

### 5.4 Residents

Due to the small volume of water per occupant (approximately 300 liters, compared to 10,000 liters in typical swimming pools), the bathing load quickly contributes a variety of contaminants into the water, such as body oils, lotions, soaps, hair, and sweat. These contaminants, along with other organic materials, can cause an increase in chlorine demand, resulting in a reduction in free available chlorine.

5.5. Associated Cases of Legionnaires' Disease. In surveys of whirlpool spas, *Legionella* have been isolated from as many as 13% of the spas sampled, but only in those spas where the disinfectant (chlorine or bromine) levels were not adequately maintained. Thus, it is generally presumed that outbreaks of Legionnaires' disease from whirlpool spas are likely to be associated with spas that have similar deficiencies in their disinfection levels.

It is universally recognized that water treatment criteria for spas (and swimming pools) should include disinfection against coliforms and other fecal pathogens (enterococci, *Vibrio*, and *Pseudomonas*). In recent years, these types of recreational and therapeutic spas have been recognized as important sources of infection by other waterborne pathogens, including *Pseudomonas aeruginosa* and *Legionella* species. Several multiple-case outbreaks of Legionnaires' disease and other diseases and fatalities have been traced to spas and hot tubs, and outbreaks have occurred. No cases of Legionnaires' disease have been traced to whirlpool baths.

### 5.6 Recommended Treatment

5.6.1. Whirlpool Spas. Whirlpool spas are currently subject to state and local regulations related to public swimming and bathing facilities. These regulations may cover all areas of operation, including mechanical specifications, operational parameters (i.e., flow rate, temperature, water velocity, and recirculation), to maintain the occurrence of whirlpool-associated infectious diseases (including Legionnaires' disease). The following guidelines are relevant.

5.6.1.1. Bathing Load. Clearly state and enforce the maximum number of occupants (1000 mg/100 ft<sup>2</sup> of surface area per bather) using this formula: 2.5 meter (8 ft) diameter circular spa would have a maximum bathing load of five at one time.

5.6.1.2. Bathing Health Restrictions. Clearly post warnings on the increased health risk related to use by individuals who are immunocompromised or who have chronic lung disease.

5.6.1.3. Filter Operation. Hygienic maintenance of spa filters is more difficult than that of swimming pool filters because of the higher rate of number of bacteria in pool water. Health codes consistently accept filter flow rates as follows:

- High rate sand filters ... 3.4-6.7 L/s per m<sup>2</sup> (3-14 gallons per ft<sup>2</sup> of filter media)
- Diatomaceous earth filters ... 1.7 L/s per m<sup>2</sup> (1.5 gallons per ft<sup>2</sup> of filter media)
- Cartridge filters ... 0.23 L/s per m<sup>2</sup> (0.375 gallons per ft<sup>2</sup> of filter media)

Maintenance of filters includes back flushing regularly to remove the buildup of organic debris. Determining the frequency of back flushing is currently based on manufacturer recommendations (flow-rate requirements) rather than microbiological criteria. As a general rule, daily back flushing may be required during periods of heavy usage. Filter cartridges should also be cleaned or replaced on a regular basis (once or twice weekly).

5.6.1.4. Water Chemistry. The American National Standards Institute and National Spa and Pool Institute (ANSI/NAPSI) have established chemical standards related to pool disinfection. The standards are generally used as a basis for most state and local regulations and have been modified slightly by the Centers for Disease Control in their "Infection Recommendations in Domestic Transmission of Legionnaires' Disease from Whirlpool Spas on Cruise Ships" (1995).<sup>27</sup>

	Minimum	Ideal	Maximum
Free chlorine (mg/L)	1.0	4.0-6.0	10.0
Combined chlorine (mg/L)	None	None	0.2
Bromine (mg/L)	4.0	4.0-6.0	10.0
pH	7.2	7.2-7.6	7.8

The upper value of 10 mg/L (free chlorine or bromine) should not be considered a routine target maintenance level; however, this level is acceptable for relatively short durations.

Ideal values should be considered minimum values for control of *Legionella* because of the relative resistance of *Legionella* to halogens (compared to other bacteria and certain viruses). Maintaining the required free available chlorine level is absolutely critical for controlling the growth of bacteria (including *Legionella*) in the spa water. Thus, these parameters should be measured frequently, as often as hourly during periods of heavy use. Automatic systems that continuously monitor the free chlorine and adjust as needed would offer the best control of the water chemistry. In addition, it would be desirable to install hydrogen level-dependent injection devices on both sides of the filter to ensure that adequate levels of biocides are maintained within the filter and within the water exiting the filter.

Several alternatives to aggressive nonbiological water treatment procedures are currently being marketed, including copper-silver ion water treatment, ozonation treatment, and ultraviolet light treatment, and ozonation. While any of all of these approaches may successfully control *Legionella* and other bacteria in pool water, there are insufficient data at the present time to recommend any water treatment device as an additional data from laboratory and real-world studies because available.

## 6. ARCHITECTURAL CONSIDERATIONS AND WATERFALL SYSTEMS

### 6.1 System Description

In these systems, water is either sprayed in the air or cascades over a steep media such as rocks, and then it returns to the non-rinse pool. This guide is not intended to enter formulas in natural bodies of water or natural waterfalls.

### 6.2 System Operation

These systems are sometimes operated intermittently with on-time when scheduled only during certain time periods. Applications can include electronic displays specifically intended to periodically attract large crowds in entertainment centers. Systems that are operated intermittently may encounter greater bioaccumulation.

**6.2.1 Temperature.** Because of the high temperature ranges needed for proliferation of *Legionella* bacteria, outdoor fountains and pools in hot climates and indoor fountains and pools subject to sources of heat may be unsuitable to becoming amplifiers. Temperature increases may be facilitated by heat from the pump/filtration systems themselves. Intermittent operation may also create situations where temperature increases occur in limited parts of the system.

### 6.3 Water Droplet Size

These systems can produce droplets of various sizes and certainly have the potential to produce droplets less than 5 micrometers. Generally speaking, the *Legionella* risk increases as the rate of aerosol production increases.

### 6.4 Materials

Fountains are subject to contamination from a wide variety of sources, including materials scrubbed from the air and returned to the pool with the falling water droplets, as well as organic and inorganic materials dropped, blown, or blown into the pool.

Algae and bacteria are recognized as a particular problem in ponds less than 1 meter (3 ft) deep. When used, filter systems are similar to the types used for swimming pools.

### 6.5 Associated Causes of *Legionnaires' Disease*

Several multiple-use outbreaks of *Legionnaires' Disease* have been associated with decorative fountains in public buildings, specifically hotels.<sup>11,14</sup> However, the true incidence of disease from these sources may be much higher due to the occurrence of isolated cases where an association with the building or the fountain was suspected.

### 6.6 Recommended Treatment

#### 6.6.1 Design Considerations

- Drains or sumps should be situated at the lowest level at the pool, with no other low points that are not served by drains or sumps.
- Provision for maintenance should be considered in the design stage. Access to pump(s) and filter(s) should be provided. Shapshot areas or areas that are difficult to clean should be avoided.

#### 6.6.2 Maintenance

- Regular cleaning is recommended.
- Use of filters should be considered; however, systems

with a small water volume may be drained and refilled with fresh water every few weeks in lieu of filtering.

### 6.6.3 Water Treatment

Microbial control is important, especially where the conditions are such that there are significant periods of time when the temperature of the fountain water is in the range that is favorable for the amplification of *Legionella* growth (see 3.2). When biocontrol is employed for retarding fouling control, the biofilm must be regulated with the Environmental Protection Agency for use in decorative fountains. For further information on water treatment, see 7.6.2 of this guideline and the "Water Treatment" chapter in the Applications volume of the ASHRAE Handbook.

## 7. COOLING TOWERS INCLUDING FLUID COOLERS (CLOSED-CIRCUIT COOLING TOWERS) AND EVAPORATIVE CONDENSERS

### 7.1 Cooling Towers

**7.1.1 System Description.** A cooling tower is an evaporative heat transfer device in which atmospheric air cools warm water, with direct contact between the water and the air, by evaporating part of the water (see Figure 2). Air movement through such a tower is typically achieved by fans, although some large cooling towers rely on natural draft circulation of air. Cooling towers typically use some media, referred to as "fill," to achieve improved contact between the water and the cooling air.

**7.1.2 System Operation.** Cooling towers associated with building water systems are typically used for rejection of waste heat from the condenser of chillers providing air conditioning for a building. Water from the cooling tower is piped to the condenser where it is heated and then back to the cooling tower to be cooled.

**7.1.2.1 Temperature.** The typical temperature of the water in cooling towers ranges from 29°C (85°F) to 35°C (95°F) although temperatures can be above 40°C (104°F) and below 21°C (70°F) depending on system heat load, ambient temperature, and system operating strategy.

Figure 2 Typical cooling tower-chiller system.

### 7.1.2.2 Circulating Water System.

Cold water piping from the cooling tower runs to one or more pumps, then to the chiller condenser, where it is heated, and then back to the fan water distribution system in the cooling tower. Considerable variation in the piping arrangement occurs. Shapshot areas or dead legs may be difficult to clean or penetrate with biocides.

A significant volume of water may be contained in the piping system.

### 7.2 Closed-Circuit Cooling Towers and Evaporative Condensers

**7.2.1 System Description.** Closed-circuit cooling towers and evaporative condensers are also evaporative heat transfer devices. Both are similar to conventional cooling towers, but there is one very significant difference. The process fluid (either a liquid such as water, an ethylene glycol/water mixture, oil, etc., or a condensing refrigerant) does not directly contact the cooling air. Rather, the process fluid is contained inside a coil assembly (see Figure 3).

**7.2.2 System Operation.** Water is drawn from the basin and pumped to a spray distribution system over the coil assembly while the cooling air is blown or drawn over the coil by fans. Removal of heat is achieved by evaporating part of the water.

**7.2.2.1 Temperature.** Water temperature in closed-circuit cooling towers and evaporative condensers is similar to that in cooling towers.

**7.2.2.2 Circulating Water System.** Most commonly, there is no external piping in these systems. Because the water is totally contained within the unit, the volume of water is generally significantly less than that with conventional cooling tower systems.

Figure 3 Typical closed-circuit cooling tower or evaporative condenser.

### 7.3 Water Droplet Size

Cooling towers and evaporative condensers incorporate inertial stripping devices called drift eliminators to remove water droplets generated within the unit. While the effectiveness of these eliminators can vary significantly with the design (new state-of-the-art eliminators are significantly more efficient than older designs) and the condition of the eliminators, it should be assumed that some water droplets in the size range of less than 5 micrometers leave the unit. In addition, some larger droplets leaving the unit may be reduced to 5 micrometers or less by evaporation.

### 7.4 Materials

Because cooling towers and evaporative condensers are highly effective air scrubbers and because they move large volumes of air, organic material and other debris can be accumulated. This material may serve as a nutrient source for *Legionella* growth. Diverse biofilms, which can support the growth of *Legionella*, may be present on heat exchanger surfaces, structural surfaces, pump surfaces, and other miscellaneous surfaces.

### 7.5 Associated Causes of *Legionnaires' Disease*

Evaporative heat rejection equipment such as cooling towers and evaporative condensers have been implicated in numerous outbreaks of *Legionnaires' Disease*, and studies have shown that detectable levels of *Legionella* are present in most, if not most, such devices.<sup>3,4-6</sup>

### 7.6 Recommended Treatment

The key recommendations are that the system be maintained clean and that a biocidal treatment program be used. It is also recommended that the services of a qualified water treatment specialist be used to define and oversee the treatment.

**7.6.1 System Maintenance.** Keeping the system clean reduces the nutrients available for *Legionella* growth. Regular visual inspections should be made for general cleanliness. The cold water coils of the unit should be cleaned when any buildup of dirt, organic matter, or other debris is visible or found through sampling. Mechanical filtration may be used to help reduce these solids. Strainers, cartridge filters, and filters can be used to assist in removal of debris.

The drift eliminators should also be inspected regularly and cleaned if required or replaced if deteriorated or damaged. Operation and maintenance records should include the following information:

- system schematic
- system water volume, with date and method of determination
- manufacturers' instructions for equipment operation
- regular water treatment procedures
- material safety data sheets for chemicals used (MSDS)
- names of persons responsible for system operation and shutdown
- dates of inspections and written results of inspections
- dates of failure maintenance
- dates of equipment repairs or modifications with description of work done

7.6.2 Water Treatment. Water treatment provides a heat transfer fluid that allows equipment to function optimally. Objectives of water treatment for cooling water systems is to use water efficiently as well as to

- maintain microbial growth.
- minimize scale.
- minimize corrosion.
- minimize sedimentation/deposition of solids (organic or inorganic) on heat transfer surfaces.

An effective water treatment program should allow more efficient operation due to lower fouling, a longer system life due to decreased corrosion, and safer operation of the system due to reduced chances of microbial exposure to the public.

Control of scaling and corrosion is necessary in many water treatment programs. Scale such as calcium carbonate and other minerals containing silica, magnesium, and phosphate may precipitate onto heat exchanger and piping surfaces. Scaling can be minimized by use of inhibitors containing phosphonates, phosphates, and polymers to keep calcium and carbonate and other minerals in solution. Corrosion can be minimized by the use of inhibitors such as phosphates, azoles, molybdenum, and zinc. Scale and corrosion inhibitors are effective if microbial fouling and biofilm development are properly controlled. Microbial fouling can interfere with cooling and corrosion processes and can affect the performance of inhibitors. Microbial biofilms on surfaces can consume certain inhibitors (such as phosphates, phosphonates, and azoles), prevent access of inhibitors to surfaces, create localized oxygen-depleted zones, change the pH near surfaces, and accumulate on trap deposits onto surfaces.

Surfactants have also been used to minimize deposition on surfaces (particularly heat transfer surfaces). When used, the surfactant must be compatible with the scale and corrosion inhibitors as well as appropriate for the type of dirt, oil, or other material that is present.

Equally important to controlling scale and corrosion is keeping the system clean and free of sediment. Common sources of sediment include materials suspended from the air (dirt, leaves, paper, ketchup or other organic exhaust), precipitated solids (calcium, magnesium, carbonate, silica), and corrosion products (rust). Microbes including bacteria, protozoa, algae, and (infrequently) fungi can grow in cooling systems and use the above materials as nutrients. Consequently, it is desirable to either prevent the entry of the material into the system or to remove it from the system.

Strategies to accomplish this include rinsing of the tower (relative to biobiochemicals, etc.), scale and corrosion control, and filtration and/or separation.

Microbial fouling is controlled by the use of biocides, which are compounds selected for their ability to kill microbes while having relatively low toxicity for plants and animals. In the USA, the Environmental Protection Agency has regulatory authority for biocides and requires registration of all biocides. In addition, registration is required in each state where the biocide will be distributed. The data package submitted to the EPA includes efficacy data against a variety of microbes and toxicity data for animals. Much of the bio-

logical data are provided by the manufacturers of the individual biocides. Biocides must be used in accordance with the directions on the label.

There are two main groups of chemical biocides: oxidizers and nonoxidizers.

Oxidizing biocides include bromine, bromo-chlorine, chlorine, chlorine dioxide, iodine, hydrogen peroxide, and other compounds with the ability to stress electrons from other components and serve as reducing agents. Oxidizing biocides can accelerate oxidation of metals if they are added at excessive concentrations. Hydrogen biocides (chlorine, bromine, and iodine) react with the protein in cell membranes to cause the proteins to become dysfunctional, thus killing/controlling the organism. Chlorine and chlorine dioxide are believed to oxidize other components of the microbial cell.

Nonoxidizing biocides include many organic compounds registered with the EPA for cooling water applications such as bromochloropropane, bromochloroacetylene, carbonates, dichlorodifluoromethane, dimethylhydroxyphenyl, thio-ethylamine, hydrochloride, glutaraldehyde, isothiazolones, carbonylase hydrochloride, quaternary phosphonium salts, and tri-4-hydroxyethylbenzylamine. Quaternary ammonium compounds are sometimes used but have been found to be ineffective against Legionella in a recent study.<sup>41</sup> These biocides function in a number of ways, including reacting with intracellular enzymes, solubilizing cell membranes, and precipitating essential proteins in microbial cell walls. Properly used, nonoxidizing biocides are effective for control of the microbial fouling process in cooling water systems.

Both oxidizers and nonoxidizers can undergo chemical reactions with materials in the water that decrease their effectiveness. Some biocides react with components of some scale and corrosion inhibitors to render both compounds less effective for their intended purpose. Selection of corrosion/scale inhibitor as well as the biocide requires a knowledge of water chemistry, a basic understanding of water microbiology, and specific information about the system (what the system is cooling, sources of contamination, etc.).

It is generally sound practice to regularly alternate the biocides used for a cooling water system to avoid the selection and growth of resistant strains of microbes. The alternating biocide approach has been emphasized with the rationale that the population that survives the biocide treatment one week is susceptible to the alternate biocide a week or two later. Altering the dose and frequency of the same biocide is also used to achieve this goal.

Because Legionella are known to enter cooling water systems in the makeup water, it should be assumed that they are present in the water along with other bacteria, protozoans, and algae. Protections are highly resistant to both oxidizing and nonoxidizing biocides; hence they must be controlled by minimizing the microbial biocides that serve to provide them nutrients.<sup>42</sup>

For further information on the subject of water treatment, see the "Water Treatment" chapter in the Applications volume of the ASHRAE Handbook.

### 7.6.3 Cooling Tower System Shutdown and Start-Up Procedures<sup>43</sup>

When the system is to be shut down for a period of more than three days, it is recommended that the entire system (cooling tower, system piping, heat exchangers, etc.) be drained to waste. When draining the system is not practical during shutdown of short duration, the stagnant cooling water must be pretreated with an appropriate biocide regimen before tower start-up.

#### Stand-By for Drained Systems

- Clean all debris, such as leaves and dirt, from the cooling tower.
- Fill the system with water. While operating the condensing water pump(s) and prior to operating the cooling tower fans, exercise one of the two alternative biocidal treatment programs described below.

(1) Treat with the biocide that had been used prior to shutdown. Utilize the services of the water treatment supplier. Maintain the maximum recommended biocide residual for the specific biocide for a sufficient period of time (freed and time will vary with the biocide) to bring the system under good biological control.

(2) Treat the system with sodium hypochlorite in a level of 4 to 5 mg/L (ppm) free chlorine residual at a pH of 7.0 to 7.6. The chlorine residual must be held at 4 to 5 mg/L (ppm) for six hours, then neutralize with standard commercial water treatment.

- Once one of the two biocidal treatment programs has been successfully completed, the fan can be turned on and the system returned to service. Resume the standard water treatment program (including biocidal treatment).

#### Stand-By for Undrained (Stagnant) Systems

Recover accessible solid debris from the cooling tower sump and from any remote storage tanks that may be used. Perform one of the two biocidal treatment procedures (described in "Stand-By for Drained Systems") directly to the cooling tower sump or remote storage tank. Do not circulate stagnant bulk cooling water over cooling tower fill in stagnant cooling tower fan during processing.

Stagnant cooling water may be circulated with the entire cooling system promptly if tower fill is bypassed. Otherwise, add approved biocide directly to the bulk water source and mix with either manual or by downstream flow methods. Take care to prevent the creation of spray from the stagnant cooling water from any point in the cooling water system.

- After biocidal pretreatment has been successfully completed, the cooling water should be circulated over the tower fill with fans off. When biocide residual is maintained at a satisfactory level for at least six hours, the cooling tower fans may be operated.

### 7.6.4 Emergency Bioremediation of Wet-Type Heat Rejection Systems for Legionella. The Cooling Tower Unit

has been furnished an "Emergency Protocol" for decommissioning cooling towers and evaporative condensers using chlorine and disinfectants.<sup>44</sup> However, this procedure must not be used routinely because it can be very corrosive and produce toxic fumes. This procedure has been adapted to include additional safety precautions and a 10 mg/L free residual chlorine level for 24 hours.<sup>45</sup>

#### 7.6.5 Stopping the Cooling Tower and Evaporative Condenser. Attention should be given to the following considerations.

- Locate as far as possible from fresh air intake, including windows that can be opened.
- Do not locate in the immediate area of kitchen exhaust fans, plants, track boys, or other sources of organic matter.
- Consider the direction of prevailing winds and do not locate upstream of nearby public areas.
- Consider future construction, including nearby sites.

### 8. DIRECT EVAPORATIVE AIR COOLERS, MISTERS (ATOMIZERS), AIR WASHERS, AND HUMIDIFIERS

#### 8.1 System Description

Direct evaporative air-cooling equipment and humidifiers cool and humidify air by direct contact with the water, either by system-surface materials (as in wetted media air coolers) or with a series of sprays (as in air washers and misters). These devices (see Figures 3 and 4) are used to control the temperature and humidity levels for commercial, industrial, and agricultural applications.

They utilize either cross-through or recirculating water. Wetted media systems may include a pump, water distribution piping, and a sump to collect or hold water. A fan may be utilized to move air across the system and distribute evaporatively cooled and humidified air to the location being served. Concentration of contaminants in the water is limited by bleed-off and quality of fresh water makeup.

8.1.1 Wetted Media. Wetted media devices utilize a porous substrate to provide an extended surface area for evaporation of water. Water is either circulated over the media or the media are raised through a water bath. Since evaporation occurs from the surface of the media, no water droplets are produced. Mist eliminations are generally not necessary. These

Figure 4 Direct evaporative air conditioning unit.

It should be noted that due to process conditions, there may be periods of time when equipment is shut down. It is common practice to drain tanks when this unit is not in use. In addition, a continuous bleed or purge cycle is usually employed to limit the buildup of solids and contaminants in the basin. High dilution rates remove bacteria, nutrients, and other contaminants before they are a problem. It is not for growth of *Legionella* to occur under these conditions.

**8.2.1 Water Temperature—Wetted Media Evaporative Air Coolers/Humidifiers and Air Washers.** For wetted media evaporative air coolers/humidifiers and air washers, the recirculating water temperature approximates the wet-bulb temperature of the airstream in which it is exposed. Since the wet-bulb temperature in most regions where these devices are used is well below 20°C (77°F), the water tends to be maintained at temperatures below the *Legionella* growth temperature range of 20–42°C (77–108°F).

**8.2.2 Water Temperature—Mistlers.** For mistlers supplied directly from the building potable water system, temperature would tend to be at the supply cold water temperature. If fed from a stagnant reservoir, or pipes exposed to heat, the temperature could increase. The temperature could exceed 25°C (77°F), which is favorable for amplification of *Legionella*.

**8.2.3 Water Temperature—Air Washers.** Air washer operating conditions are based on the requirements of the process; however, a standard operating temperature range for circulating water is 4–10°C (40–50°F). The normal operating portions of air washer systems tend to be sublethal to temperatures below the *Legionella* growth temperature range of 20–42°C (77–108°F).

**8.3 Water Droplet Size**

**8.3.1 Wetted Media.** Wetted media equipment generally produces few droplets during operation. However, large droplets may form as a result of improper maintenance and incorrect water or air distribution. The exact size of the droplets will vary with the condition of the wetted media and mist eliminators (where used), air velocity through the unit, and irrigation rate. It should be assumed that under extreme conditions droplets of less than 5 micrometers could be created.

**8.3.2 Air Washers.** The major causes of droplets being entrained into the airstream are failed spray nozzles and damaged or dirty mist eliminators. Air washers can produce droplets of various sizes and certainly have the potential to produce droplets less than 5 micrometers in diameter.

**8.3.3 Mistlers.** These systems can produce droplets of varying size and certainly have the potential to produce droplets less than 5 micrometers in diameter.

**8.4 Mistlers**  
Because direct evaporative air coolers/humidifiers are efficient air scrubbers and move large volumes of air, organic matter and other debris can be recirculated. This may serve as a nutrient source for *Legionella* growth.

**8.4.1 Wetted Media Evaporative Air Coolers/Humidifiers and Air Washers.** Wetted media evaporative coolers/humidifiers and air washers have potential for growth where dirt, scale, or biological matter can accumulate. Most

Figure 2. Single trade air washer humidifier.

devices utilize either once-through potable building water or are equipped with a recirculating system including a pump, automatic makeup water valve, a bleed-off/purge, and a positive draining reservoir.

**8.4.2 Air Washers.** Air washers utilize high-pressure nozzles to reduce water to small droplets for efficient evaporation. These systems have a chamber or casing containing one or more banks of spray nozzles and drift eliminators. Air washers contain a pump for collecting and holding excess spray water. The eliminator section removes entrained droplets of water from the air. Air washers also utilize either once-through potable building water or are equipped with a recirculating system including a pump, automatic makeup water valve, a bleed-off/purge, and a positive draining reservoir. The water may be chilled for additional cooling and/or dehumidification.

**8.4.3 Mistlers.** Mistlers produce an aerosol by use of ultrasonic devices, spinning disks, or spray nozzles. Normally these devices are supplied with fresh potable water directly from the building water system. However, some systems contain a reservoir.

**8.4.3.1 Heated Element and Steam-Type Humidifiers.** Heated element and steam-type humidifiers convert water to vapor that is discharged into the space being conditioned. Due to the elevated temperature and the fact that water droplets are not generated, these humidifiers are not considered a risk for the growth of *Legionella* during normal operation. However, if the humidifier is improperly installed, moisture may accumulate in the duct and lead to bacterial growth. During periods of time when equipment is not in use, all water should be drained from the system to avoid the possibility of bacterial growth.

**8.5 System Operation**

See 8.1.

Slurry areas of sedimentation are collection troughs, mist eliminators, or waste storage tanks.

**8.4.1 Mistlers.** Nutrient availability would be minimal when first potable water directly from the building potable water system. If distribution piping and/or a building reservoir is used, nutrients in the form of scale and other debris may exist.

**8.5 Recommended Treatment**

**8.5.1 All Systems.** Regular inspection and maintenance of evaporative air coolers/humidifiers, air washers, mistlers, and auxiliary equipment are recommended. Avoid dead-end piping, low spots, and other areas in the water distribution system where water may stagnate during shutdown.

Consider the use of photobiological assay procedures to control microbial concentrations in water in tanks and distribution piping. Water filters and air filters should be cleaned as required. The entire cooling water loop should be cleaned and flushed regularly.

**8.5.2 Recirculating Systems.** Proper pump water level or spray pressure must be maintained. Bleeding air or purging some of the water is the most practical means to minimize scale and nutrient accumulation. The bleed rate or purge depends on water quality (including hardness) and air/water contaminant level. Regular inspections should be made to ensure that the bleed rate or purge is adequate and is maintained. As an added precaution, pumps should be automatically drained during shutdown of the fan. When it is impractical to shut a system down for cleaning, it should be provided with a positive draining pump and easily accessible flush-out of the water distribution header so it can be flushed during operation. After flushing, once the recirculating cooling water with a biocide approved by the EPA for such applications.

**8.5.3 Air Washers.** Use corrosion inhibitors to prevent corrosion of metals in the system and formation of corrosion products. Control the level of suspended solids that can support nutrients and growth areas for *Legionella*. Ideally, the microbiological activity should be controlled through the utilization of biocides approved by the EPA for such applications.

**8.5.4 Wetted Media Evaporative Air Coolers/Humidifiers.** Media located inside a large built-up air house may not dry completely during periods of shutdown (i.e., weekends), resulting in stagnation. In order to dry out the media, pumps should be shut down prior to scheduled fan shutdowns. Smaller systems and those having the media braced adjacent to inlet doors normally dry sufficiently without assistance. For systems experiencing high-contaminant loading, a flush-out cycle may be used that runs fresh water through the pad every 24 hours during a period of time when the system is not in operation. Media should be cleaned or replaced when necessary.

**8.5.5 Mistlers.** Never recirculate stagnant water. Drain pipes and reservoir when equipment is not in use. For portable mistlers, drain and disassemble piping and reservoir regularly. Only sterile water should be added to the reservoir of portable humidifiers used in health care environments or in other areas

where immunocompromised persons are likely to be exposed to the generated aerosols.

**8.6 Sizing**

Evaporative air coolers/humidifiers should not be located near the outlet of a cooling tower, fluid cooler, evaporative condenser, kitchen exhaust, or any other source of organic contamination. Filtration upstream of the evaporative air conditioner is recommended when particulate contamination is expected. Filtration downstream of the equipment must be a sufficient distance to allow absorption of moisture into the air stream.

**8.7 Associated Causes of Legionnaires' Disease**

There have been no documented cases of *Legionnaires' disease* with air washers, wetted media evaporative air coolers/humidifiers, or steam humidifiers. A supersaturated vegetable steaming device using water from a holding tank was implicated in one outbreak of *Legionnaires' disease*.<sup>13</sup> There is a documented case of *Legionnaires' disease* that occurred in a hospital setting and resulted from aerosolized tap water from a humidifier.<sup>14,15</sup>

## 9. INDIRECT EVAPORATIVE AIR COOLERS

Indirect evaporative air coolers cool air in a heat exchanger, which transfers heat to a secondary airstream as shown in Figure 6. Although the primary air is cooled by the evaporatively cooled secondary air, no moisture is added to the primary air.

**9.3 System Description**

The heat exchanger is cooled by evaporation of water utilizing one of several methods:

1. direct wetting of the heat exchanger surface
2. cooling of secondary air utilizing evaporative cooling media
3. atomizing spray into secondary airstream or onto heat exchanger surface
4. cooling tower and coil.

Figure 6. Indirect evaporative cooler.

46. Associated Cases of Legionnaires' Disease

Measles, mumps, and rubella have been implicated in the outbreak of Pontiac fever as well as acute respiratory syndrome and hypersensitivity pneumonitis.<sup>45</sup>

47. Recommendations for Treatment

Exposure from environmental sources can be a serious potential health concern, the magnitude of which is not fully understood. Bacteria are supplied with fluid environments, which are diluted water used and/or added to the fluid reservoir. However, the variety of fluids, microbial types, sources, and onset operations makes successful dosing not always predictable. Selection of bacteria should be based on fluids and strains being treated.

It is recommended that care be taken to minimize contamination and to reduce exposure to machine operators until further information is available.

48. RECOMMENDATIONS FOR LEGIONELLA

Collecting for Legionella may be appropriate if exposed to a specific purpose, such as verifying the effectiveness of a water treatment process, tracing the source of an outbreak, evaluating the potential for transmission sources as a facility, verifying that the disinfection procedures have been effective, or in health care facilities caring for patients with exceedingly high risk of developing Legionnaires' disease (e.g., organ transplant recipients).<sup>46,47</sup> Where culturing is performed, proper sampling, handling, and shipping methods should be used.<sup>48</sup>

However, as discussed in 5.5.1.5, routine culturing of samples from building water systems may not be predictive of the risk of transmission for the following reasons:

1. Presence of the organism cannot be directly equated to the risk of infection. The bacterium is frequently present in water systems without being associated with human cases of disease.
2. Interpretation of the results of culturing of water is confounded by use of different microbiologic methods in various laboratories, by variable culture results among sites sampled within a water system, and by fluctuations in the concentration of Legionella isolated from a single site.
3. The risk of illness following exposure to a given source is influenced by a number of factors other than the concentration of organisms in a sample. These factors include, but are not limited to, water volume, host susceptibility, and how efficiently the organisms are aerosolized to the small particles required to reach the deep portion of the bronchus and remain viable.
4. Test results only represent the counts at the time the sample was collected. A negative result from such a sample is likely to lead to a false sense of security because any amplifier can quickly become heavily colonized if it is not replaced.

Testing is not a substitute for sound maintenance practices and water treatment.

49. System Operation

50.1. Temperature. The recirculated water temperature approximates the wet-bulb temperature of the secondary air stream. As in the case with direct evaporative air coolers, it is unlikely that the water temperature will exceed 25°C (77°F).

50.2. Water Droplet Size

Water droplet size will vary with exchange type, condition of the media and mist eliminators (where used), air velocity through the unit, and other factors. Refer to the section of this guideline regarding specific exchange type, i.e., cooling towers, misters, etc.

50.3. Pseudomonas

See 7.4 for equipment using a cooling tower to cool the secondary airstream and 8.4 for equipment using evaporative coolers to maintain to cool the secondary airstream.

50.4. Recommendations for Treatment

See 7.4 for equipment using a cooling tower to cool the secondary airstream and 8.4 for equipment using evaporative coolers to maintain to cool the secondary airstream.

50.5. Stilling

Indirect evaporative air coolers should not be located near the outlet of a cooling tower, fluid cooler, evaporative condenser, kitchen exhaust, paint booth, incinerator, or any other source of organic matter.

50.6. Associated Cases

There has been no positive association of Legionnaires' disease with indirect evaporative air coolers.

50.7. RECOMMENDATIONS SYSTEMS

50.8. System Description

In these systems, noncondensing fluids are applied to cooling surfaces for lubrication and to prevent overheating of both the machine tool and the machine part.

50.9. System Operation

Both oil-based and water-based fluids are used. A variety of wet fluids are commercially available from many companies.

As a rule, microbial growth does not occur in oil-based fluids. However, water-based fluids do become colonized by microorganisms.

50.10. Temperature. As the fluids cool the machine tool and machine part, they become heated and the ambient temperature of the fluid ranges between 24° and 32°C (75°F and 90°F), permitting the growth of many pathogens including Legionella species.

50.11. Water Droplet Size

These systems can produce droplets of varying size depending on the specific conditioning operation and have the potential to produce droplets less than 5 micrometers in size.

50.12. Mistants

These systems are typically open and subject to contamination from the air and surfaces that are being machined.

POLICY STATEMENT CONCERNING ASHRAE'S CONCERN  
FOR THE ENVIRONMENTAL IMPACT OF ITS ACTIVITIES

ASHRAE is concerned with the impact of its members' activities on both the indoor and outdoor environment. ASHRAE's members will strive to minimize any possible deleterious effect on the indoor and outdoor environment of the systems and components in their responsibility while maintaining the beneficial effects these systems provide, consistent with accepted standards and the practical state of the art.

ASHRAE's objectives shall be to ensure that the systems and components within its scope do not impact the indoor and outdoor environment to a greater extent than specified by the standards and guidelines as established by local and other responsible bodies.

As an ongoing goal, ASHRAE will, through its Standards Committee and existing technical committee structure, continue to generate up-to-date standards and guidelines which incorporate and adapt, measurements, and promote those new and revised standards developed by other responsible organizations.

Through its Handbook, appropriate chapters will contain up-to-date standards and design considerations as the industry is systematically revised.

ASHRAE will have the best with respect to dissemination of environmental information of its primary interest and will seek out and disseminate information from other responsible organizations that is pertinent, as guides to updating standards and guidelines.

The effects of the design and selection of equipment and systems will be considered within the scope of the systems' standard use and associated process. The disposal of hazardous materials, if any, will also be considered.

ASHRAE's primary concern for environmental impact will be at the time where equipment within ASHRAE's scope operates. However, energy source selection and the possible environmental impact due to the energy source and energy transportation will be considered where possible. Recommendations concerning energy source selection should be made by its members.

Ask Alan if there's anyone dot to contact about software installation for me/Justin

MDEQ McLaren/Hurley meeting  
Meeting w/ city

Hurley - don't have water safety plan or HACP  
MDEQ providing information. Don't do any water monitoring for leg or chlorine. Does flush system

McLaren - monitoring sept/oct Jan feb, march, April  
Continuous treatment syst <sup>boosting disinfectant</sup> treated as public drinking water. Hyperchlorination oct/nov, doing every 6 mos  
April monitoring chlorine residuals. Have a control plan needs to be updated. Cant temper hot water maintain 98-110 temp. Doing monthly tests, trying to standardize sampling protocol

water main breaks? spreadsheet provided? currently ~4/day  
City doesn't maintain flushing records  
water age map sept, oct, novemb, hoping for new map  
2013-2014 winter had big impact in Flint

2014  
400 breaks

Data being requested by MDCH and/or suggested data collection needs to be addressed:

- 1) Please provide the name of the primary point-of-contact for the overall GCHD legionellosis investigation. Shurooq Hasan is lead on the CD investigation. Jim Henry is the lead on the water system investigation. Our entire CDIRT team is involved in both investigations.
- 2) The current copy of the GCHD Legionnaires Disease outbreak data collection line list is requested and updates sent to MDCH on a regular basis. Let us know the time table you are proposing. We would like to request a regular meeting schedule so we can discuss our mutual findings.
- 3) Onset dates or estimated onset dates need to be determined for all cases. As discussed during our call, we can provide estimated onset dates. We would like your input...would you prefer we report the onset date reported by the patient, their primary care physician or the ID Physician consulting? There are differences. Please keep this in mind when reviewing the data.
- 4) A current map of the municipal water system needs to be obtained and cases' residences mapped in relation to the water system. As discussed in our call, we are experiencing difficulty in obtaining the information we have requested from DWP and MDEQ. We have sent the FOIA request for the current map of the municipal water system. As discussed during our call, we have mapped our cases to look for commonalities and to identify the proximity of the cases to the boil water advisories.
- 5) The investigation needs a Genesee-specific supplemental questionnaire beyond the MDCH supplemental form and the 6 questions in the email message dated 10/17/14. As discussed in our call, GCHD has been identifying and reaching out to individuals with expertise with type 1 water supplies. During our call, we asked specifically if anyone at MDCH has this expertise. Please let us know if you have a staff member we can consult with. Also stated during our call, we requested the assistance of MDCH in creating our Genesee specific questionnaire....the questionnaire we are currently using. We are reaching out to water experts to assist in the updating of our questionnaire. In the limited conversations we have had so far, we have learned a great deal which will inform the questions we need to ask. We also look forward to additional conversations with our MDCH colleagues
- 6) All previous cases (since 5/1/14) and new cases should be re-interviewed as soon as possible with the new outbreak-specific questionnaire. If cases are not available, then a proxy should be interviewed, ideally someone from the same household. See me notes below...
- 7) To look for cases of milder illness such as Pontiac Fever, the questionnaire should ask if there are other household members who have had a similar respiratory illness. Any household contacts with legionellosis-consistent illness should also be interviewed with the outbreak-specific questionnaire. As discussed on the call in the review of our investigations, we have found this and, we have been reporting this... and have reported them in MDSS. This is the reason why we asked for testing of clinical samples not only of the patients, but, also of their close contacts.
- 8) Clinical culture specimens, in addition to urine antigen testing, should be collected from all suspect cases where individuals are seeking medical care. As discussed in our call, this is what we have requested from MDCH. In addition, we requested testing of close contacts, environmental testing of the patient home environments and potentially testing of key locations in the community with high heterotrophic plate counts. Based on the feedback from our consultations, this may be very helpful.
- 9) Hospitals should be queried to determine whether any previously diagnosed cases had respiratory cultures collected and whether any of these culture specimens were retained. If so, it should be requested that these samples be held until a determination on environmental testing can be made. This was discussed at our Bug Fuzz meeting on 1/22/15. We will also be requesting more information regarding previous years legionella testing. We suspect a

W Study  
onset  
language

Joan Rose  
support

significant increase in the numbers of tests conducted, particularly during August/September than in previous years. Remember, the hyperchlorination done at our hospital of interest was completed 10/4/15. That may also influence the number of tests conducted.

Assistance that MDCH can provide to Genesee to aid in the outbreak investigation:

- 1) MDCH can provide language to GCHD for distribution to the medical community regarding the request for clinical respiratory culture collection on all suspect cases of legionellosis (Legionnaire's Disease and Pontiac Fever). What we specifically requested was the specific testing protocols for sample collection, storage and transportation of clinical samples. We also requested testing of environmental samples from patient homes and key community sites. We would like the same protocol information for this type of testing as well. Jim's email covered some of this, but, we still have some questions.
- 2) MDCH staff is available to conduct medical record extraction, as needed. Medical records are attached in MDSS and we do not need assistance with this at this time.
- 3) MDCH staff can assist with data entry into MDSS, as needed. At this time, we do not need assistance with this. Please see the note below...
- 4) MDCH staff can help with the development of a Genesee-specific outbreak questionnaire. We welcome your participation in the revision of our Genesee specific questionnaire. We have already received some helpful feedback from our expert consultations.
- 5) MDCH is willing to assist with supplemental questionnaire data collection by conducting case interviews (on previously and/or newly diagnosed cases) and also by assisting with data analysis, as needed. Our CD nurses can address newly diagnosed cases. We would like to discuss MDCH's assistance for conducting interviews with previously diagnosed/interviewed cases.
- 6) MDCH can assist with the coordination and communication with MDEQ for specific data requests by GCHD. As discussed in our call, we are requesting MDCH assistance with obtaining information from MDEQ. GCHD has sent a FOIA letter requesting the information we have not been able to obtain regarding the water system. If we do not receive the information or have other challenges we would request MDCH assistance in obtaining the information.
- 7) The MDCH PIO can work with the GCHD PIO to develop a coordinated public health message to respond to public and media inquiries. As discussed in our call, the water system is an extremely sensitive topic. We are very careful in crafting messages. Should we need MDCH PIO assistance, we will request it.

- 1) line list by end of week - MDCH
- 2) send out HAN by the end of week? If not, what's a reasonable timeframe.
- 3) draft legionellosis questionnaire by Wed. next wk. finalized  
- Sherran, Lily environmental assessment
- 4) Hurley - OK leg. cases

## Preliminary Stats on Genesee County Legionellosis Investigation,

April 7, 2015

Number of lab-confirmed cases of Legionnaires' Disease: 45

Number of Pontiac fever cases: 1 possible

Total number of legionellosis cases: 46

Geographic distribution:

45/46 Genesee Co (27 Flint, 6 Mt. Morris, 4 Burton, 2 Flint Twp, 1 Flushing, 1 Byron, 1 Davison, 1 Linden, 1 Otisville, 1 Vienna Twp)

1/46 Saginaw County (1 Chesaning)

Age range: 26-94 years

Average age (median): 62.2 years (63.5 years)

% Males: 50% (23/46)

Range of illness onset dates (n=45): 6/6/14-1/10/15 (new case onset 3/9/2015)

Number (%) of deaths: 15.2% (7/46); expect this number will increase as interviews are completed

Number (%) with other underlying comorbidities: TBD

Conference calls with Genesee County: Jan 27; Feb 10, Feb 19, Apr 7, 2015

Conference calls with hospitals: Jan 28, 2015

Date outbreak-specific survey completed and approved: 2/23/15

Number of cases interviewed: 21 completed (45.7%; 82.6% in total attempted/completed; 7 still unassigned)

MDCH: 14 completed / 29 contacted (MDCH had 2 interviewers – now increased to 4)

Genesee: 7 completed / 10 , 3 left - 2 passed away - no next of kin  
1 person left

Number (%) of cases hospitalized: 45/46 (97.8%). Number in ICU: 22/45 (48.8%)

Number (%) of cases hospitalized at McLaren: 18/45 (40%)

Number (%) of cases hospitalized at Hurley: 14/45 (31%)

Number (%) of cases hospitalized at Genesys: 6/45 (13.3%)

McLaren Legionella

- hospitals in area receiving water  
- water age map from DEQ

hyperchlorination

water main breaks / flushing of system

Number (%) of cases hospitalized at other hospitals outside Flint: 7/45 (15.6%)

Number (%) of cases who had been hospitalized in 2-weeks prior to onset: 20/45 (44.4%)

Number (%) of cases who had been hospitalized in 2-weeks prior to onset at McLaren: 16/45 (35.6%)

Number (%) of cases who had been hospitalized in 2-weeks prior to onset at Hurley: 2/45 (4%)

Number (%) of cases who had been hospitalized in 2-weeks prior to onset at Genesys: 0

Number (%) of cases who had been hospitalized in 2-weeks prior to onset at other hospitals: unknown

Number (%) of cases who had a short-term visit to a hospital in 2-weeks prior to onset:

Number (%) of cases who had a short-term visit to McLaren facility in 2-weeks prior to onset: 5/45 (11.1%)

Number (%) of cases who had a short-term visit to Hurley facility in 2-weeks prior to onset: 1/45 (2%)

Number (%) of cases who had a short-term visit to Genesys facility in 2-weeks prior to onset: 0

Number (%) of cases who had been hospitalized or who had a short-term visit to a hospital facility in 2-weeks prior to onset:

Number (%) of cases who had been hospitalized or who had a short-term visit to a McLaren facility in 2-weeks prior to onset: 21/45 (46.7%)

Number (%) of cases who had been hospitalized or who had a short-term visit to a Hurley facility in 2-weeks prior to onset: 3/45 (6.7%)

Number (%) of cases who had been hospitalized or who had a short-term visit to a Genesys facility in 2-weeks prior to onset: 0

Number (%) of cases who work outside the home: 8/46 (17.4%) [min of 72% at home]

Number (%) of cases who are retired: 20 (43.5%)

Number (%) of cases who are unemployed: 7/46 (15.2%)

Number (%) of cases who are disabled: 6/46 (13%)

Number (%) of cases whose occupation status is unknown: 5/46 (10%)

Number (%) of cases whose homes are on Flint water: 45.6% (21/46)

May/June  
4/5 associated w/ McLaren

Updates/information on the new June cases:

Any new information from McLaren:

Any recent environmental test results?: monthly testing in 4 locations of hosp:  
identifying leg = hyperchlorinate every 6 mos. 3x in past 9 mos.  
hyp. chlor. in april, identified leg right after stop @ 4ppm  
not looking at specific rooms pt. Stayed in. Any culture over 100 wait  
use room  
Any updates from Genesee water department?:  
- schedule for flushing hydrants 75% complete  
Cold water <1  
hot water colonized  
Aware of any changes to water processing in the city system?:  
releasing a lot of sediment, worked through  
most of the city, focusing on community concerns  
reducing THM/Brown water: improved chemical  
cocktail; install EPC envir. consulting  
Discussion on any modifications to data collection tools: carbon filters by end of June Cooling tower <1  
no boiled water  
advisories recently; had  
significant # of water  
main breaks  
- more water line work compared  
to last year

TBD

Lab results on 2 sputum specimens- pending at Bol.

- still pending at Bol

Genesee POC?:

- Suzanne POC for outbreak

- Bonnie stepping down 7/16

Future investigation plans:

- information consulting/remediation firms
- direct environmental testing re: results clinical
- environmental sampling

GCHD

Call Sue Forrest

- updated line list
- clinical specimens

06/24/2014- Bug Fuzz Meeting- Hospitals discussed legionella cases that had been previously hospitalized at McLaren. Began monitoring legionella cases that were previously hospitalized (especially at McLaren) – GCHD did not note a significant increase in Legionella

07/2014- Total cases hospitalized from McLaren- 3

08/20/2014 CDIRT-Discussed increase in Legionella – Started to talk to McLaren around this time (suspect cooling towers as potential source, planned meeting with engineering department to discuss their investigation) 6 cases hospitalized from McLaren out of 13

9/4/2014- McLaren identifies location of their patients with legionella, found them same towers but different floors. They have hired someone to inspect the air valves on 13<sup>th</sup> floor and will keep us updated. 10 out of 18 total cases from McLaren

9/05/2014-McLaren First Test

9/26/2014- Test results returned to McLaren

10/4/2014- McLaren does hyper chlorination

10/15/2014- CDIRT-Discussed Legionella- 15 Total cases in September McLaren hyper chlorinated, more cases- Jim to talk to DEQ, develop Environmental survey for cases

10/30/2014- Jim meets with McLaren +DPW- we get results for Heterotrophic plate count (October only) and McLaren results for testing- McLaren will continue to test monthly for legionella, they have a plan in place for remediation if necessary.

## 2015 Genesee Legionellosis Analysis

- 2nd wave analysis may-Nov.
- total picture 2014-2015
- Genesee comments on draft
- validate outpatient visits
- B PFLGE
- \* - Christine has urine antigen from 1 hosp - email
- \* Mark Edwards 2 high leg

2014 - onset to interview data average

2015 - onset to interview data averages

\* validate water residence

\* onset to interview 2015, back to 2014

\* combine urine lists over next couple days

Hi Ann,

I actually didn't get this email yesterday, but Suzanne forwarded it to me. Sending in case you haven't received it. Not sure why the links aren't in order at the bottom, but the newest summary is the second one: "Updated 5-15 to 11-15 Legionellosis Analysis Summary.pdf"

Thanks,

Shannon

## **MDHHS issues 2015 Legionnaires Disease Report for Genesee County**

*LANSING, Mich.* – The Michigan Department of Health and Human Services today issued its report regarding the increase of Legionnaires' disease (LD) during 2015 in Genesee County. MDHHS cannot conclude that the increase is related to the water switch in Flint nor can we rule out a possible association at this time.

From May 2015 through October 2015, 42 LD cases were reported in Genesee County. Data previously indicated three Legionnaires associated deaths from May 2015 through October 2015, however additional case information received has brought this number to four.

"While cases of Legionnaires disease are not expected in the winter, we remain fully engaged with the Genesee County Health Department as well as our federal partners at the Centers for Disease Control and Prevention to protect the health of Flint residents," said Eden Wells, M.D., Chief Medical Executive with the MDHHS. "We remain diligent in our efforts to proactively and appropriately address the potential for future cases."

*Legionella* is a type of bacteria commonly found in the environment that grows best in warm water, such as hot tubs, cooling towers, hot water tanks, potable water systems, and decorative fountains. When people are exposed to the bacteria, it can cause Legionellosis, a respiratory disease that can infect the lungs and cause pneumonia. The bacteria can also cause a less serious infection called Pontiac fever. *Legionella* is not transmitted person to person.

The state today also released an updated report for cases from June 2014 to March 2015. During that time, 45 LD cases were confirmed in Genesee County, including five associated fatalities. The report issued on January 13 originally identified seven fatalities during that time period.

Consistent with published literature, legionella related deaths are defined as fatalities that occurred within 30 days of hospital discharge. While the number of cases remain unchanged for LD in Genesee County, the total associated fatalities is now nine because some cases occurred outside of the 30 day period.

During LD outbreak investigations, clinical isolates, or case specimens, are often evaluated against environmental specimens to aid in determining an infection source. One reason that the increase in cases cannot be directly related to the change in Flint water supply is due to the lack of clinical *Legionella* isolates from case patients. Clinical isolates are necessary to interpret the findings of an environmental investigation in an outbreak. Although a limited number of clinical isolates are available from the 2015 cases, there are not enough to determine a conclusive environmental source.

Of the 87 total confirmed cases between June 2014 and November 2015, 31 people, or 35.6 percent, received city of Flint water to their residence. A total of 26 people, or 29.8 percent, had no known exposure to a Flint hospital on the city of Flint water system in the two weeks prior to illness, nor were their homes on the Flint water system. Other possible exposures were evaluated and no known community exposures were identified. Enhanced surveillance will continue in 2016.

MDHHS has been and continues to work with the Genesee County Health Department (GCHD), Michigan Department of Environmental Quality (DEQ), Centers for Disease Control and Prevention (CDC) and the Environmental Protection Agency (EPA) on this matter. MDHHS shared an initial report with local and federal partners in June 2015, and has continued to facilitate regular communication with our federal partners and GCHD to monitor cases.

### **MDHHS issues 2015 Legionnaires Disease Report for Genesee County**

**LANSING, Mich.** – The Michigan Department of Health and Human Services today issued its report regarding the increase of Legionnaires' disease (LD) during 2015 in Genesee County. MDHHS cannot conclude that the increase is related to the water switch in Flint nor can we rule out a possible association at this time.

From May 2015 through October 2015, 42 LD cases were reported in Genesee County. Data previously indicated three Legionnaires associated deaths from May 2015 through October 2015, however additional case information received has brought this number to four.

"While cases of Legionnaires disease are not expected in the winter, we remain fully engaged with the Genesee County Health Department as well as our federal partners at the Centers for Disease Control and Prevention to protect the health of Flint residents," said Eden Wells, M.D., Chief Medical Executive with the MDHHS. "We remain diligent in our efforts to proactively and appropriately address the potential for future cases."

*Legionella* is a type of bacteria commonly found in the environment that grows best in warm water, such as hot tubs, cooling towers, hot water tanks, potable water systems, and decorative fountains. When people are exposed to the bacteria, it can cause Legionellosis, a respiratory disease that can infect the lungs and cause pneumonia. The bacteria can also cause a less serious infection called Pontiac fever. *Legionella* is not transmitted person to person.

The state today also released an updated report for cases from June 2014 to March 2015. During that time, 45 LD cases were confirmed in Genesee County, including five associated fatalities. The report issued on January 13 originally identified seven fatalities during that time period.

Consistent with published literature, legionella related deaths are defined as fatalities that occurred within 30 days of hospital discharge. While the number of cases remain unchanged for LD in Genesee County, the total associated fatalities is now nine because some cases occurred outside of the 30 day period.

During LD outbreak investigations, clinical isolates, or case specimens, are often evaluated against environmental specimens to aid in determining an infection source. One reason that the increase in cases cannot be directly related to the change in Flint water supply is due to the lack of clinical *Legionella* isolates from case patients. Clinical isolates are necessary to interpret the findings of an environmental investigation in an outbreak. Although a limited number of clinical isolates are available from the 2015 cases, there are not enough to determine a conclusive environmental source.

- MORE -

Of the 87 total confirmed cases between June 2014 and November 2015, 31 people, or 35.6 percent, received city of Flint water to their residence. A total of 26 people, or 29.8 percent, had no known exposure to a Flint hospital on the city of Flint water system in the two weeks prior to illness, nor were their homes on the Flint water system. Other possible exposures were evaluated and no known community exposures were identified. Enhanced surveillance will continue in 2016.

MDHHS has been and continues to work with the Genesee County Health Department (GCHD), Michigan Department of Environmental Quality (DEQ), Centers for Disease Control and Prevention (CDC) and the Environmental Protection Agency (EPA) on this matter. MDHHS shared an initial report with local and federal partners in June 2015, and has continued to facilitate regular communication with our federal partners and GCHD to monitor cases.

conducted

2

4/5X. Using the enhanced Legionellosis Questionnaire, conduct an interview as quickly as possible with ~~case~~ <sup>patient</sup> or proxy and upload to the MDSS record when completed.

~~Questionnaires should be completed within one week.~~

5/9. Confirm via medical record reviews or contact with ICPs whether the individual had any inpatient or outpatient hospital exposures at any other hospital (McLaren, Hurley, or Genesys) during the 2 weeks prior to onset.

~~Laboratory Follow-up~~ (see current clinical guidelines for additional details)

1. Within 24 h of case notification, call the ICP at the diagnosing hospital to verify that a respiratory specimen was collected for culture.
2. Respiratory specimens should be collected in conjunction with a <sup>urine</sup> urine antigen test, before the initiation of antibiotics, if possible. Even if antibiotics have been started, a respiratory specimen should still be collected.
  - a. If a specimen has not been collected, verify that an order has been placed for a respiratory specimen collection by the physician. Request that the ICP follow-up with the physician about collecting the specimen as soon as possible.
  - b. If no respiratory specimen collection has been ordered, work with the hospital ICP to request it be ordered and collected as soon as possible.
  - c. If a specimen was collected, determine whether the hospital lab will be conducting the culture in-house or whether the clinical specimen should be sent directly to BOL.
  - d. For cases with a positive <sup>urine</sup> urine antigen where the culture is not being done at the hospital, have the respiratory specimen sent immediately at refrigeration temperature overnight (or via courier) to the MDHHS BOL.
3. If the *Legionella* culture is positive, verify that the hospital will send the isolate on a slant on cold packs to BOL immediately overnight (or via courier) for PFGE testing.
  - a. If the *Legionella* culture is negative but the patient has a positive <sup>urine</sup> urine antigen, have the hospital immediately send the remaining respiratory specimen overnight (or via courier) at whatever temperature it has been maintained at (i.e., refrigerated or frozen) to the MDHHS BOL for repeat culture.
  - b. If the individual has a negative <sup>urine</sup> urine antigen and the hospital is not performing cultures, or the individual has a negative <sup>urine</sup> urine antigen and negative culture, but there is still clinical suspicion of legionellosis review the clinical information and any available labs (e.g., influenza or RSV testing, etc.) with the physician. Determine whether it is appropriate to send the specimen to BOL for additional testing. <sup>in discussion w/ MDHHS</sup>
4. Monitor specimen/isolate results from BOL.
5. Determine whether additional testing of negative cultures at CDC is appropriate.
6. Based on clinical laboratory results and information collected from interview/medical record, evaluate with investigation team if environmental sampling is appropriate.
7. Continued review/analysis of data including medical records, questionnaires, and laboratory results from clinical and environmental testing (if collected).

2. maintain case line list ~~of demographics~~ <sup>enhanced</sup> consistent w/ 2014-2015 line list and including questionnaire information / exposure data

Can  
overall  
Investigation  
Group

Please provide a copy of your plan to address all of the specifics of case referral surveillance at the GCHD.

There are expectations for any public health organization that conducts surveillance and investigation around legionellosis. These expectations include a variety of activities ranging from the active engagement of community partners to the timely, thorough and accurate evaluation of individually reported cases.

<sup>MDHHS</sup>  
It is the expectation of this department, that by accepting these responsibilities, the Genesee County Health Department will adequately address all of the items identified below.

Recognizing the resource demands of this effort, the MDHHS continues to offer support of any aspects of the surveillance process that the GCHD cannot effectively address. <sup>capitalized italics</sup>

As we enter the warmer spring and summer months that are more conducive to legionella transmission, there are two primary areas of community outreach that should serve as the backdrop in support of surveillance activities. First, with the finalization of the CDC/MDHHS/GCHD Toolkit that focuses on the development of a water management program to prevent Legionella in "high risk" buildings, a valuable resource is now available to help direct water management in facilities throughout Genesee County. In addition to this document, the partnership has produced a preliminary list of facilities that are likely to be identified as being at elevated risk of legionella transmission. It is the expectation that the GCHD can deliver in the next week, a plan for the effective distribution and support of the toolkit at these facilities. <sup>who, when, how</sup>

<sup>what does support mean?</sup> <sup>follow-up; how documented?</sup>  
Second, it is a longstanding and effective public health practice to reach out to the healthcare community in response to increases in reported legionellosis. While the MDHHS has provided two HAN updates to Genesee's healthcare community in recent months, active communications are still warranted. These communications are best focused on the need for continued vigilance for incident cases of disease, heightened index of suspicion toward the diagnosis of cases, appropriate testing, and simultaneous specimen collection. Consistent reinforcement of these messages is an important part in the process of identifying incident disease in any community. The GCHD must produce a plan that enumerates the steps, actions, materials, and timeline for local public health engagement of the healthcare community.

Finally, every legionellosis referral to the MDSS warrants a timely, appropriate, complete, and consistent public health evaluation. This evaluation includes communication with the diagnosing clinician, support for specimen collection/transport, review of clinical records, completion of patient/proxy interviews, and updating of electronic disease surveillance records.

Once a suspect or confirmed Legionellosis case is identified:

1. Enter the case into MDSS within 24 h of notification if not already entered by provider or lab
2. Email the Regional Epidemiologist with the MDSS number <sup>for clinical follow-up</sup>
3. <sup>Clinical Follow-up</sup>
  - a. Contact the diagnosing hospital ICP or physician to:
    - a b. Verify that a respiratory specimen was collected, and if it was collected prior to the initiation of antibiotics or after (see the follow-up below)
    - b c. Obtain the medical record for the legionellosis hospitalization <sup>follow-up</sup>
    - c d. Verify the illness onset date
    - d e. Collect any additional information about the clinical course of illness
    - e f. Recommend additional testing, as needed (e.g., if serology is done, a convalescent serum must be drawn 2-4 weeks after the initial acute draw)
  - b. Verify whether the case was previously hospitalized at the diagnosing facility during the 2 weeks prior to onset

- (within one week)
- Using the enhanced Legionellosis Questionnaire, conduct an interview as quickly as possible with ~~case~~ <sup>patient</sup> or proxy and upload to the MDSS record when completed. ~~Questionnaires should be completed within one week.~~
  - Confirm via medical record reviews or contact with ICPs whether the individual had any inpatient or outpatient hospital exposures at any other hospital (McLaren, Hurley, or Genesys) during the 2 weeks prior to onset.

Specimen  
Laboratory Follow-up (see current clinical guidelines for additional details)

- Within 24 h of case notification, call the ICP at the diagnosing hospital to verify that a respiratory specimen was collected for culture.
- Respiratory specimens should be collected in conjunction with a <sup>urinary</sup> urine antigen test, before the initiation of antibiotics, if possible. Even if antibiotics have been started, a respiratory specimen should still be collected.
  - If a specimen has not been collected, verify that an order has been placed for a respiratory specimen collection by the physician. Request that the ICP follow-up with the physician about collecting the specimen as soon as possible.
  - If no respiratory specimen collection has been ordered, work with the hospital ICP to request it be ordered and collected as soon as possible.
  - If a specimen was collected, determine whether the hospital lab will be conducting the culture in-house or whether the clinical specimen should be sent directly to Bol. ~~MDHHS BOL~~ <sup>MDHHS BOL</sup>
  - For cases with a positive urine antigen where the culture is not being done at the hospital, have the respiratory specimen sent immediately at refrigeration temperature overnight (or via courier) to the MDHHS BOL.
- If the *Legionella* culture is positive, verify that the hospital will send the isolate on a slant <sup>with</sup> cold packs to BOL immediately overnight (or via courier) for PFGE testing.
  - If the *Legionella* culture is negative but the patient has a positive urine antigen, have the hospital immediately send the remaining respiratory specimen overnight (or via courier) at whatever temperature it has been maintained at (i.e., refrigerated or frozen) to the MDHHS BOL for repeat culture.
  - If the individual has a negative urine antigen and the hospital is not performing cultures, or the individual has a negative urine antigen and negative culture, but there is still clinical suspicion of legionellosis review the clinical information and any available labs (e.g., influenza or RSV testing, etc.) with the physician. Determine whether it is appropriate to send the specimen to BOL for additional testing. <sup>in discussion w/ MDHHS</sup>
- Monitor specimen/isolate results from BOL.
- Determine whether additional testing of negative cultures at CDC is appropriate.
- Based on clinical laboratory results and information collected from interview/medical record, evaluate with investigation team if environmental sampling is appropriate.
- Continued review/analysis of data including medical records, questionnaires, and laboratory results from clinical and environmental testing (if collected).

<sup>consistent w/ questionnaire data (exposure/history data from questionnaire)</sup>  
Maintain line list ~~w/ demographic~~

Chart  
Continued investigation follow-up

Please provide a copy of your plan to address all of the specifics of case referral surveillance at the GCHD.

There are expectations for any public health organization that conducts surveillance and investigation around legionellosis. These expectations include a variety of activities ranging from the active engagement of community partners to the timely, thorough and accurate evaluation of individually reported cases.

It is the expectation of this department, <sup>months</sup> that by accepting these responsibilities, the Genesee County Health Department will adequately address all of the items identified below.

Recognizing the resource demands of this effort, the MDHHS continues to offer support of any aspects of the surveillance process that the GCHD cannot effectively address.

As we enter the warmer spring and summer months that are more conducive to legionella transmission, there are two primary areas of community outreach that should serve as the backdrop in support of surveillance activities. First, with the finalization of the CDC/MDHHS/GCHD Toolkit that focuses on the development of a water management program to prevent Legionella in "high risk" buildings, a valuable resource is now available to help direct water management in facilities throughout Genesee County. In addition to this document, the partnership has produced a preliminary list of facilities that are likely to be identified as being at elevated risk of legionella transmission. It is the expectation that the GCHD can deliver in the next week, a plan for the effective distribution and support of the toolkit at these facilities. *documented how?*

Second, it is a longstanding and effective public health practice to reach out to the healthcare community in response to increases in reported legionellosis. While the MDHHS has provided two HAN updates to Genesee's healthcare community in recent months, active communications *on current status* are still warranted. These communications are best focused on the need for continued vigilance for incident cases of disease, heightened index of suspicion toward the diagnosis of cases, appropriate testing and simultaneous specimen collection. Consistent reinforcement of these messages is an important part in the process of identifying incident disease in any community. The GCHD must produce a plan that enumerates the steps, actions, materials and timeline for local public health engagement of the healthcare community.

Finally, every legionellosis referral to the MDSS warrants a timely, appropriate, complete and consistent public health evaluation. This evaluation includes communication with the diagnosing clinician, support for specimen collection/transport, review of clinical records, completion of patient/proxy interviews and updating of electronic disease surveillance records.

Once a suspect or confirmed Legionellosis case is identified:

1. Enter the case into MDSS within 24 h of notification if not already entered by provider or lab
2. Email the Regional Epidemiologist with the MDSS number *2 pathways for follow-up*
3. *Clinical follow-up*
  - a. Contact the diagnosing hospital ICP or physician *for clinical follow-up*
  - b. Verify that a respiratory specimen was collected, and if it was collected prior to the initiation of antibiotics or after (see lab follow-up below)
  - c. Obtain the medical record for the legionellosis hospitalization
  - d. Verify the illness onset date *(est. procedure to determine illness onset dates)*
  - e. Collect any additional information about the clinical course of illness *(duration of hospitalization, death directly)*
  - f. Recommend additional testing, as needed (e.g., if serology is done, a convalescent serum must be drawn 2-4 weeks after the initial acute draw)
4. Verify whether the case was previously hospitalized at the diagnosing facility during the 2 weeks prior to onset

*Get Discharge Summary*

4. Using the enhanced Legionellosis Questionnaire, conduct an interview as quickly as possible with case or proxy and upload to the MDSS record when completed. ~~Questionnaires should be completed~~ (within one week).
5. Confirm via medical record reviews or contact with ICPs whether the individual had any inpatient or outpatient hospital exposures at any other hospital (McLaren, Hurley, or Genesys) during the 2 weeks prior to onset.

*Specimen*  
Laboratory Follow-up (see current clinical guidelines for additional details)

1. Within 24 h of case notification, call the ICP at the diagnosing hospital to verify that a respiratory specimen was collected for culture.
2. Respiratory specimens should be collected in conjunction with a urine <sup>am</sup> antigen test, before the initiation of antibiotics, if possible. Even if antibiotics have been started, a respiratory specimen should still be collected.
  - a. If a specimen has not been collected, verify that an order has been placed for a respiratory specimen collection by the physician. Request that the ICP follow-up with the physician about collecting the specimen as soon as possible.
  - b. If no respiratory specimen collection has been ordered, work with the hospital ICP to request it be ordered and collected as soon as possible.
  - c. If a specimen was collected, determine whether the hospital lab will be conducting the culture in-house or whether the clinical specimen should be sent directly to BOL.
- d. For cases with a positive urine <sup>am</sup> antigen where the culture is not being done at the hospital, have the respiratory specimen sent immediately at refrigeration temperature overnight (or via courier) to the MDHHS BOL.
3. If the *Legionella* culture is positive, verify that the hospital will send the isolate on a slant on cold packs to BOL immediately overnight (or via courier) for PFGE testing.
  - a. If the *Legionella* culture is negative but the patient has a positive urine antigen, have the hospital immediately send the remaining respiratory specimen overnight (or via courier) at whatever temperature it has been maintained at (i.e., refrigerated or frozen) to the MDHHS BOL for repeat culture.
  - b. If the individual has a negative urine antigen and the hospital is not performing cultures, or the individual has a negative urine antigen and negative culture, but there is still clinical suspicion of legionellosis review the clinical information and any available labs (e.g., influenza or RSV testing, etc.) with the physician. Determine whether it is appropriate to send the specimen to BOL for additional testing.

4. Monitor specimen/isolate results from BOL.
5. Determine whether additional testing of negative cultures at CDC is appropriate. *in consultation with MDHHS*
6. Based on clinical laboratory results and information collected from interview/medical record, evaluate with investigation team if environmental sampling is appropriate.
7. Continued review/analysis of data including medical records, questionnaires, and laboratory results from clinical and environmental testing (if collected).

6. overall investigation follow-up.

## Enhanced Surveillance and Monitoring for *Legionella* in Flint, Michigan

### Wayne State University Flint Investigation Team

1. Active enhanced surveillance for suspected case identification
  - a. Case reporting from health care providers
    - i. Active reporting will be utilized
    - ii. Requires phone, email, internet or direct reporting
    - iii. Direct reporting from health care providers will require engagement of health care institutions
      1. Will identify point person for case form completion and reporting
      2. Line listing of identified suspected cases with completion of one-page active surveillance form (modeled on standard CDC investigation form)
  - b. Case reporting from healthcare institutions
    - i. Emergency Departments (Appendix 1)
    - ii. Outpatient clinics
    - iii. Hospitalists/Inpatient Departments
  - c. Other case reporting sources
    - i. Federally qualified health centers
    - ii. Public health clinics (of Flint)
    - iii. Community organizations
2. Clinical case confirmation and case review with data collection
  - a. Clinical signs and symptoms review, data collection
    - i. Standard data will be abstracted from electronic or paper health records
    - ii. Data will be de-identified for study analytic purposes
  - b. Physical exam and exam data collection
    - i. Standard data collection for physical characteristics; including systems relevant for *Legionella* disease (e.g., cardiopulmonary, others)
  - c. Radiologic examination review and data collection
    - i. Chest x-ray (CXR) interpretation and recording of CXR reading

- ii. Include other studies as performed for patient

d. Laboratory tests and test data collection

- i. Routine lab test results will be collected from electronic and paper health records (e.g., liver function, kidney function, hematologic tests)
- ii. Non-routine tests will also be recorded (e.g., Erythrocyte sedimentation rate, C-reactive protein, and the like)

e. *Legionella* specific and other microbiological testing (culture, antigen detection) and data collection

- i. *Legionella* urinary antigen testing and data collection
- ii. *Legionella* culture testing and data collection
- iii. Other pathogen testing for individual patients and data collection

f. Molecular analysis (*Legionella* genotyping, virulence factor analysis) and lab data collection

- i. PCR testing for *Legionella* using standardized assay (commercially available primers) and data collection
- ii. Laboratory testing and analysis to characterize *Legionella* virulence factors and data collection

3. **Epidemiologic investigation with data collection**

a. Interview of suspected case participants and their families

- i. Make interview contact (direct or via community support)
- ii. Schedule interview appointment
- iii. Household or hospital visit for interview
- iv. Conduct interview using standardized, tested instrument

b. Systematic identification and interview of control participants

- i. Age-matched
- ii. Neighborhood-matched

c. Exposure identification among cases and controls

- i. Personal and SES characteristics (i.e., age, gender, education, and the like)
- ii. Health histories (i.e., past medical histories, current list of health problems)

- iii. Household and work environment exposures (i.e., smoke, cooking, shower, whirlpools, etc...)
  - iv. Other environmental exposures (e.g., pool, spa, whirlpool, garden hose water)
- d. Data management, collation and cleaning of electronic case data
- i. Clinical data/variables (including electronic data from health care institutions)
  - ii. Laboratory data (including electronic clinical lab values, micro lab data, reference lab results from molecular *Legionella* testing)
  - iii. Epidemiologic/personal and household member interview data
  - iv. Cleaning and merger of datasets
  - v. Preliminary analysis to run descriptive data tables and figures
4. Analysis, interpretation and review of data
- a. Interim analysis of risk factors
    - i. 2-way contingency table analysis
  - b. Additional data cleaning, descriptive and multivariate risk factor analysis
    - i. Unadjusted and adjusted multivariate analysis
    - ii. Logistic regression analysis
  - c. Geographic analysis
    - i. Descriptive distribution of *Legionella* case information
    - ii. Mapping of case and control participants
    - iii. Time and geographic analysis for patterns of *Legionella*

## Summary

From May 2015 to October 2015, 43 legionellosis cases, all confirmed Legionnaires' disease (LD), were reported as part of an outbreak in Genesee County, Michigan. Forty-two of these cases were among residents of Genesee County. One additional case-patient from outside of Genesee County was hospitalized in Genesee during the 2 weeks prior to their onset. Five individuals have died. The Michigan Department of Health and Human Services (MDHHS) assisted the Genesee County Health Department (GCHD) during their investigation.

Data were collected from patient medical record review, the Michigan Disease Surveillance System case report form, and interviews with case-patients or their proxies using an enhanced legionellosis questionnaire. In an attempt to identify community sources, case-patients or proxies were interviewed about travel, work, and locations visited during the 2 weeks prior to symptom onset (considered the incubation period for LD during an outbreak investigation).

Median patient age was 68 years (range: 35–89); 23 (53%) were male. Illness onset dates ranged from May 2, 2015 to October 29, 2015 and peaked in July with 12 cases. Case-patients were interviewed by GCHD using an enhanced questionnaire; interviews were conducted for 40 of 43 (93%) case-patients.

Healthcare-associated LD was suspected for a subset of cases. Over half of the case-patients (24/43) had an exposure to at least one Genesee County hospital facility in the 2 weeks prior to their illness onset. In addition, all 24 case-patients had at least one exposure (inpatient, outpatient, or visitor) to the same hospital facility within the 2 weeks prior to onset.

The source of water at the residence where the case-patient lived during the 2 weeks prior to onset was evaluated. Ten of 43 (23%) cases occurred in individuals whose residence was serviced by the City of Flint municipal water system. Seven of those 10 individuals also had an exposure to the same Genesee County hospital during their incubation period. Among the 33 individuals whose residence is not serviced by the City of Flint municipal water system, 17 had an exposure to a Genesee County hospital during the 2 weeks prior to onset. In total, 16 out of 43 case-patients did not reside on the City of Flint water system and had no known healthcare exposure.

Questionnaire interview data were evaluated for other potential common community exposures. No other common community locations, beyond the healthcare facility, were reported by more than 4 individuals. Three different grocery stores and one home improvement store were each reported to have been visited by 4 individuals in the 2 weeks prior to their onset. These 3 grocery stores and the home improvement store are not located on the City of Flint water system.

All 43 cases were laboratory confirmed by *Legionella* urinary antigen test. Twelve sputum specimens were submitted to the MDHHS Bureau of laboratories (BoL) for *Legionella* culture and pulsed-field gel electrophoresis (PFGE) testing. Four samples were unsuitable for PFGE typing (3 were culture negative and one was received contaminated). The remaining 8 specimens were culture-positive and all 8 isolates were PFGE typed; 2 isolates had matching PFGE patterns, while 6 were unique (non-matching patterns). Seven of the 8 isolates were from individuals who did not reside on the City of Flint municipal water system. The remaining isolate was from a case-patient with a residence serviced by the City of Flint water system and was 1 of the 2 isolates obtained from case-patients with a hospital exposure during the 2 weeks prior to illness onset.

No environmental samples were forwarded to the MDHHS laboratory for testing during this investigation. CDC protocol does not recommend environmental specimen collection from case-patient residences. In addition, no common community exposures were identified from case-patient interviews for environmental evaluation and/or testing. In October, 2015, MDHHS was provided with a summary of the environmental testing conducted at the Genesee County hospital where 24/43 case-patients had a healthcare exposure. The report indicated that environmental samples collected at that facility in August of 2015 tested positive for *Legionella*. No environmental samples collected from the hospital were submitted to the MDHHS lab for further testing.

Enhanced surveillance will continue in 2016. From 2009–2013, an average of 9 confirmed legionellosis cases per year (range 5–13 cases per year) were reported in Genesee County. No new cases of legionellosis were confirmed in Genesee County between November, 2014 and February, 2015. However, MDHHS recommends continued vigilant legionellosis awareness and surveillance, including interviewing of case-patients or proxies with the enhanced legionellosis questionnaire within one week of reporting. MDHHS also recommends the assistance of the clinical community in LD surveillance through identification, testing, and reporting of all suspect cases. Prompt collection of clinical respiratory specimens in addition to and at the same time as urinary antigen testing is of critical importance in these increased surveillance efforts. Because *Legionella* bacteria are commonly found in the environment, clinical isolates are necessary to interpret the findings of an environmental investigation in an outbreak. MDHHS has distributed updated legionellosis guidance to health care providers via the Michigan Health Alert Network.

### Working Case Definitions

Confirmed Legionnaires' Disease (LD) – meets the CDC clinical and laboratory case definition for confirmed LD and illness occurred since May 1, 2015 in residents of Genesee County or those who had visited the Flint area in 2 weeks prior to their LD illness onset date.

### Data Sources

1. Legionellosis Case Report Form in Michigan Disease Surveillance System (MDSS)
2. Medical record review from:
  - a. Hospital A; Flint, MI
  - b. Hospital B; Flint, MI
  - c. Hospital C; Grand Blanc, MI
3. Case-patient/proxy interview using Genesee County specific Legionellosis Questionnaire
4. City of Flint water distribution map

### Epidemiology

Number of lab-confirmed cases of Legionnaires' disease: 43

Geographic distribution: 42/43 Genesee County (15/42 City of Flint residence), 1 non-Genesee County resident

Case-patients with residence on the City of Flint water system: 10/43 (23.3%)

Age: Range: 35-89 years  
Average age: 67.4 years  
Median age: 68 years

Sex: Males, 23/43 (53.5%)

Range of illness onset dates (N=43): 5/2/2015–10/29/2015

Death associated with legionellosis was defined as one that occurred during hospitalization, within 30 days of hospital discharge, or where Legionellosis was listed as a cause of death on the death certificate. (Ref. Mykietiak A et al. Clin Infect Dis. 2005 Mar 15;40(6): 794-9.)

Deaths: 5/43 (11.6%)

4/5 (80%) individuals had an inpatient Genesee County hospital exposure in the 2 weeks prior to illness onset

0/5 (0%) individuals lived at a residence on the City of Flint water system in the 2 weeks prior to illness onset

Case-patients interviewed: 40/43 (93.0%); 38 completed plus 2 partial interviews

Case-patients hospitalized for legionellosis illness: 43/43 (100%)

Case-patients with an inpatient (overnight) Genesee County hospital exposure in the 2 weeks prior to illness onset: 23/43 (53.5%)

Case-patients with any healthcare exposure (inpatient, outpatient, or visitor) to a Genesee County hospital in the 2 weeks prior to illness onset: 24/43 (55.8%)

Case-patients with  $\geq 1$  comorbidity: 35/43 (81.4%)

Case-patients who are current or former smokers: 30/42 (71.4%)

## Epi Curves

### Five-year History

Note: If onset date was not available, referral date was used (i.e., date that the case was referred to public health). The graph includes two cases (one in 2014, one in 2015) in non-Genesee County residents who were hospitalized in Genesee County during the 2 weeks prior to illness onset.

### Outbreak 1: June 2014–March 2015 (Previous Cases)

### Outbreak 2: May 2015–October 2015 (Cases Analyzed in Current Report)

This report summarizes data collected from 43 confirmed legionellosis cases that were reported May, 2015 through October, 2015. The final case included in the analysis had an illness onset at the end of October, but was reported to public health the beginning of November.

## Cases by Residence Water Source

Residence water source refers to the source of tap water at the case-patient's home residence during the 2 weeks before symptom onset and was determined by case-patient interview and verified by the City of Flint map. Of the 43 cases, one case-patient had exposure to both a private well and other municipal source during the 2 weeks prior to onset, accounting for the increase in the total (N=44) in the table below.

Water Source at Residence	Total N=44	
	N	%
City of Flint water	10	22.7
Other municipal water system	14	31.8
Private well	17	38.6
Flint Township Water	0	0
Unknown*	3	6.8

\*Represents three questionnaires that were not completed. Per the Flint map, these residences are not located on the City of Flint Water system; it is unknown if the residence water sources are private wells or other municipal water systems.

## Healthcare Exposure

A person was defined as having a healthcare exposure if they visited a hospital in Genesee County as an inpatient (overnight), outpatient, or visitor during the 2 weeks prior to their legionellosis symptom onset date. Hospitals A, B, and C are located in Genesee County. The City of Flint supplies water to Hospitals A and B.

### Healthcare Exposure by Residence Water Source

Residence Water Source	Healthcare exposure n=24		No known healthcare exposure n=19		Total N=43	
	n	%	n	%	n	%
City of Flint water	7	29.2	3	15.8	10	23.2
Other water at residence	17	70.8	16	84.2	33	76.7

### Healthcare Exposures by Hospitals Location and Residence Water Source

Healthcare exposure in 2 weeks prior to legionellosis symptom onset	Residence on City of Flint water	Residence NOT on City of Flint water	Total N=43
Hospitalized at Hospital A	5	15	20
Hospitalized at Hospital A and Hospital C	1	0	1
Hospitalized at Hospital A and Hospital Y*	1	0	1
Hospitalized at Hospital A and Hospital Z*	0	1	1
Visited Hospital A and Hospital B	0	1	1
No known Genesee hospital healthcare exposure	3	16	19
Total	10	33	43

\*Hospitals Y and Z are located outside of Genesee County.

Healthcare exposure to a Genesee County hospital during the 2 weeks prior to onset:

7/10 (70%) case-patients with City of Flint water at their residence had a healthcare exposure to a Genesee County hospital during the 2 weeks prior to onset

5/7 (71.4%) had a hospitalization at Hospital A

1/7 (14.3%) had a hospitalization at Hospital A and Hospital C

1/7 (14.3%) had a hospitalization at Hospital A and Hospital Y (non-Genesee County)

17/33 (51.5%) case-patients NOT on City of Flint water at their residence had a healthcare exposure to a Genesee County hospital during the 2 weeks prior to onset

15/17 (88.2%) had a hospitalization at Hospital A

1/17 (5.9%) had a hospitalization at Hospital A and Hospital Z (non-Genesee County) during the entire 2 weeks prior to onset

1/17 (5.9%) visited both Hospital A and Hospital B

23/43 (53.5%) case-patients were hospitalized (overnight) at Hospital A during the 2 weeks prior to onset

24/43 (55.8%) case-patients had an exposure (inpatient, outpatient, visitor) to Hospital A during the 2 weeks prior to onset

19/43 (44.2%) case-patients had no known hospital exposure during the 2 weeks prior to onset

16/43 (37.2%) case-patients had no known hospital exposure and did not have City of Flint water at their residence

Healthcare-associated Legionellosis Cases by Hospital Location

Consistent with the working case definition used for this outbreak, a case was defined as definitely healthcare-associated if the case-patient was hospitalized continuously for at least the 14 days prior to legionellosis symptom onset. A case was defined as possibly healthcare-associated if they had exposure to a hospital for a portion of the 2-14 days prior to legionellosis symptom onset. (Ref. Demirjian A et al. *Clin Infect Dis*. 2015 June 1;60(11): 1596-1602.)

Healthcare exposure in 2 weeks prior to legionellosis symptom onset	Definitely healthcare-associated	Possibly healthcare-associated	Not healthcare-associated
Hospitalized at Hospital A	0	20	0
Hospitalized at Hospital A and Hospital C	0	1	0
Hospitalized at Hospital A and Hospital Y*	0	1	0
Hospitalized at Hospital A and Hospital Z*	1	0	0
Visited Hospital A and Hospital B	0	1	0
No known Genesee hospital healthcare exposure	0	0	19
Total	1	23	19

\*Hospitals Y and Z are located outside of Genesee County.

### Prior Inpatient Hospitalization Cases by Length of Stay and Residence Water Source

Prior inpatient hospitalization was defined as a person who was an inpatient (overnight) at a hospital in Genesee County within the 2 weeks prior to legionellosis symptom onset. Length of stay was defined as the number of nights hospitalized at a hospital in Genesee County during the 2 weeks prior to legionellosis symptom onset.

Location	Length of Stay		
	N	Median (days)	Range
Hospital A*	22	5	1–11
Individuals with City of Flint water at residence	6	8.5	1–9
Individuals with other water at residence	16	4.5	1–11
Hospital A and Hospital C Individual's residence on City of Flint water	1		
Hospital A		1	
Hospital C		6	
Total	23	5	1–11

\*Two people hospitalized at Hospital A also had additional inpatient stays at hospitals outside of Genesee County during the 2 weeks prior to onset; one case-patient for 5 days (Hospital Y) and another for 10 days (Hospital Z).

### Epi Curve by Hospital A Exposure

**Legionellosis Cases by Onset Date and Hospital A Exposure  
During the Two Weeks Prior to Onset  
May 2015 – December 2015**

## Legionellosis Questionnaire Results

Data were obtained from case-patient or proxy interviews using the enhanced legionellosis questionnaire.

Column percentages are displayed. The denominators are based on the number of case-patients interviewed.

### Interview Status by Healthcare Exposure

A person was defined as having a healthcare exposure if they visited a hospital in Genesee County as an inpatient, outpatient, or visitor during the 2 weeks prior to their legionellosis symptom onset date.

Interview status	Healthcare Exposure n=24		No Known Healthcare Exposure n=19		Total N=43	
	n	%	n	%	N	%
Complete interview	21	87.5	17	89.5	38	88.4
Partial interview	1	4.2	1	5.3	2	4.7
Refused	0	0.0	0	0.0	0	0.0
Unable to contact	2	8.3	1	5.3	3	7.0

### Interview Status by Residence Water Supply

Interview status	Flint water at residence n=10		Other water at residence n=33		Total N=43	
	n	%	n	%	N	%
Complete interview	9	90.0	29	87.9	38	88.4
Partial interview	0	0.0	2	6.1	2	4.7
Refused	0	0.0	0	0.0	0	0.0
Unable to contact	1	10.0	2	6.1	3	7.0

## Water Changes at Residence

### Question Prompts:

Q4. During the last year, has the water pressure at your residence changed?

Q5. During the last year, has the water quality (appearance, taste, smell) at your residence changed?

Q6. Prior to your illness, did you make any recent plumbing changes or repairs at your residence?

Q7. Prior to your illness, were there any water main breaks or other water line issues that affected the water at your residence, including boil water advisories?

	City of Flint water at Residence n=9		Other Water Source at Residence n=30		Total N=39*	
	n	%	n	%	N	%
Q4. Noticed changes in water pressure	2	22.2	6	20.0	8	20.5
Healthcare exposure	1		1		2	
No known healthcare exposure	1		5		6	
Q5. Noticed changes in water quality	7	77.8	5	16.7	11	28.2
Healthcare exposure	3		2		4	
No known healthcare exposure	4		3		7	
Q6. Made recent plumbing changes or repairs at residence	0	0.0	1	3.3	1	2.6
Healthcare exposure	0		1		1	
No known healthcare exposure	0		0		0	
Q7. Experienced water main breaks or water line issues that affected residence	1	11.1	2	6.7	3	7.7
Healthcare exposure	0		0		0	
No known healthcare exposure	1		2		3	

\* Does not include one person who was interviewed but did not answer these questions.

## Work and Travel

### Question Prompts:

- Q8. During this 2 week period (exposure period), did you work or volunteer, either full or part time?
- Q10. Visit, reside, or work in a long term care facility, nursing home, assisted living facility, or senior living facility?
- Q11. In the 2 weeks before you before you got sick, did you spend any nights away from home (excluding healthcare settings)?

Work and Travel, n (%)	City of Flint Water At Residence n=7	Other Water Source At Residence n=28	Total N=35*
Q8. Work/volunteer outside of home (all different locations outside of Flint)	0 (0.0)	7 (25.0)	7 (20.0)
Q10. Reside or visit an assisted living facility or rehab facility (all different facilities outside of Flint)	0 (0.0)	4 (14.3)	4 (11.4)
Q11. Spend nights away from home (all different locations outside of Flint)	0 (0.0)	5 (17.9)	5 (14.3)

\* Does not include data from 5 interviewees. 4 individuals were interviewed based on an incorrect exposure time period and one person did not answer these questions.

## Community Exposures

Question prompt:

Q12. In the 2 weeks before you got sick, did you visit any of the following community venues?

Community Venue, n (%)	Healthcare Exposure		No Known Healthcare Exposure		Total N=35*
	City of Flint Water At Residence n=5	Other Water At Residence n=15	City of Flint Water At Residence n=2	Other Water At Residence n=13	
Hotel without staying overnight (unknown location)	0 (0.0)	0 (0.0)	0 (0.0)	1 (7.7)	1 (2.9)
Auditorium (outside of Flint)	0 (0.0)	0 (0.0)	0 (0.0)	1 (7.7)	1 (2.9)

\* Does not include data from 5 interviewees. 4 individuals were interviewed based on an incorrect exposure time period and one individual did not answer these questions.

\*\* The individual locations do not equal the total because some individuals visited more than one location.

Question prompt:

Q13. In the 2 weeks before you got sick, did you have exposure to any of the following water sources, either *at home* or while *away from home*?

### Water Exposures in the Home

Water exposure, n (%)	Healthcare Exposure		No Known Healthcare Exposure		Total N=34*
	City of Flint Water At Residence n=5	Other Water At Residence n=14	City of Flint Water At Residence n=2	Other Water At Residence n=13	
Shower	5 (100.0)	12 (85.7)	2 (100.0)	13 (100.0)	32 (94.1)
Use a detachable shower head or hose	2 (40.0)	6 (42.9)	1 (50.0)	6 (46.2)	15 (44.1)
Hot tub, whirlpool spa, Jacuzzi tub	0 (0.0)	0 (0.0)	0 (0.0)	1 (7.7)	1 (2.9)
Sat NEAR hot tub or whirlpool spa	0 (0.0)	0 (0.0)	0 (0.0)	1 (7.7)	1 (2.9)
Steam room or wet sauna	0 (0.0)	0 (0.0)	0 (0.0)	0 (0.0)	0 (0.0)
Humidifier	1 (20.0)	2 (14.3)	0 (0.0)	3 (23.1)	6 (17.6)
Respiratory therapy machine	0 (0.0)	2 (14.3)	0 (0.0)	1 (7.7)	3 (8.8)
CPAP	0	1	0	1	
Nebulizer	0	1	0	0	

\* Does not include data from 6 interviewees. Four individuals were interviewed based on an incorrect exposure time period and two individuals did not answer these questions.

### Water Exposures Outside of the Home

Water Exposure, n (%)	Healthcare Exposure		No Known Healthcare Exposure		Total N=34*
	City of Flint Water At Residence n=5	Other Water At Residence n=14	City of Flint Water At Residence n=2	Other Water At Residence n=13	
Showered outside the home	1 (20.0)	1 (7.1)	0 (0.0)	4 (30.8)	6 (17.6)
Use a detachable shower head or hose	1 (20.0)	1 (7.1)	0 (0.0)	2 (15.4)	4 (11.8)

Unknown	1 (14.3)	0 (0.0)	0 (0.0)	0 (0.0)	1 (2.4)
Drinks alcohol	0 (0.0)	5 (29.4)	2 (66.7)	6 (37.5)	13 (30.2)
Does not drink alcohol	3 (42.9)	10 (58.8)	1 (33.3)	7 (43.8)	21 (48.8)
Unknown	4 (57.1)	2 (11.8)	0 (0.0)	3 (18.8)	9 (20.9)

\* Number increased compared to previous tables because of data from medical records and self-reported health behaviors.

## Epi Summary of Cases with No Known Healthcare Exposure

Number of cases in individuals with no known healthcare exposure to a Genesee County Hospital: 19/43 (44.2%)

Geographic residence distribution: 19 Genesee County (7 Flint, 12 non-Flint)

Residence on City of Flint water system: 3/19 (15.8%)

Age range: 45–89 years

Average age (median): 66.4 years (63 years)

Sex: males, 9/19 (47.4%)

Legionellosis symptom onset dates from May 27, 2015 – October 29, 2015

*L. pneumophila* isolates obtained: 6/19 (31.6%); among the 6 isolates, none had matching PFGE patterns to each other.

During their two week exposure period:

- 5/19 (26.3%) case-patients reported visiting a community location on the City of Flint water system
  - 2/5 (40.0%) individuals also have City of Flint water at their residence
  - All different locations; no location on the City of Flint water system was reported by more than one individual
- 14/19 (73.7%) case-patients visited a grocery store
  - 2 individuals visited two different grocery stores on the City of Flint water system
  - At most, 4 people reported visiting the same grocery store, which is not on the City of Flint water system
- 9/19 (47.4%) case-patients visited a doctor's office or clinic
  - 10 different locations (1 on City of Flint water system; 1 not on City of Flint water; 8 non-Flint locations)
- 6/19 (31.6%) case-patients visited a place of worship
  - 5 different locations (1 on City of Flint water system; 4 non-Flint locations) and 1 unknown location
- 4/19 (21.0%) case-patients visited home improvement stores
  - At most, 3 people reported visiting the same home improvement store, which is not on the City of Flint water system
- 4/19 (21.0%) case-patients had an overnight stay away from home
  - 4 different locations; all non-Flint locations
- 3/19 (15.8%) case-patients visited a barbershop or salon
  - 3 different locations (1 on City of Flint water system; 2 non-Flint locations)

## Cases with No Known Healthcare Exposure and Residence not on City of Flint Water Supply

### Case Flow-chart

### Epi Curve

## Laboratory Testing

Out of 43 cases, 12 sputum specimens were received at the MDHHS BoL for additional testing. Three specimens were culture negative; one specimen was received contaminated and unable to be tested. *L. pneumophila* was cultured from 8 of the 12 specimens; all 8 isolates were typed by PFGE. Two of these case-patients had inpatient hospitalizations in the 2 weeks prior to the onset of illness; one of the two hospitalized case-patients also had a residence on the City of Flint water system. While the number of samples available for additional testing increased relative to the previous year (cases from June, 2014–March, 2015), the isolates represent only 19% of the current cases (May–Nov, 2015). The collection of respiratory culture specimens remains a priority for the continued surveillance in 2016.

	Total N = 43	
	n	%
Urinary Antigen Positive	43	100
Sputum Culture Positive		
Yes ( <i>Legionella pneumophila</i> serogroup 1)	8	18.6
No (Specimen culture negative or specimen received contaminated)	4	9.3
Specimen culture not collected by hospital or not received at MDHHS Lab	31	72.1

## Pulsed-field gel electrophoresis (PFGE) Testing Summary

Number of legionellosis cases with PFGE performed: 8

Geographic residence distribution: 8 Genesee County (3 Flint, 5 non-Flint)

Residence on City of Flint water system: 1/8 (12.5%)

Age range: 45-85 years

Average age (median): 60.3 years (56 years)

Sex: Males, 4/8 (50%)

Number of cases interviewed: 7/8 (87.5%); 6 completed plus one partial interview

PFGE results: 6/8 isolates had unique (non-matching) PFGE patterns:

Onset	Healthcare exposure during the 2 weeks prior to onset?	Residence on City of Flint water system?	Enhanced questionnaire interview able to be completed?
July, 2015	No	No	Yes
July, 2015	No	No	Yes
July, 2015	No	No	Yes
August, 2015	No	No	Yes
Sept, 2015	Yes- Hospital A & Hospital C	Yes	Yes
Sept, 2015	No	No	Partial interview

2/8 isolates had matching PFGE patterns:

Onset	Healthcare exposure during the 2 weeks prior to onset?	Residence on City of Flint water system?	Enhanced questionnaire interview able to be completed?
May, 2015	Yes- Hospital A	No	Yes
August, 2015	No (Hospital visitor status unknown)	No	No

## Flint Water System Issues Discussion Agenda

Monday, January 4<sup>th</sup>

11am

Call In , code

- 1.) Water System Review-Risk Assessment
  - a.) Legionella risk assessment
  - b.) Other water related illness risk assessment
  - c.) Other contaminate risk assessment
- 2.) ASHRAE 188 Education/Outreach Resources
- 3.) Lessons Learned from Other Communities
- 4.) Risk assessment Communication Resources
- 5.) Review of Legionella Questionnaire-feedback requested
- 6.) Health Assessment Advisory Team

# MDHHS Preliminary Data on Genesee County Legionellosis Investigation (April 29, 2015)

## Epi Info Analysis of Questionnaire Data

30 cases of 46 have been interviewed so far (65% interviewed). Of these interviews, 29 are complete and 1 interview was refused half way through (97% completed, 63% of all cases).

3.) Where did you get your tap (drinking and other household use) water from \_\_\_/\_\_\_/\_\_\_ to \_\_\_/\_\_\_/\_\_\_?

Water Source	Number	%
City of Flint Water	13	43
City of Flint Township Water	3	10
Other municipal water system	4	13
Private well	7	23
Unknown	3	10
TOTAL	30	100

4.) During the last year, has the water pressure at your residence changed?

Variable	Yes	%	No	%	Unk	%	Total Number
City of Flint Water	2	67	8	36	3	60	13
City of Flint Township Water	0	0	2	9	1	20	3
Other municipal water system	0	0	3	14	1	20	4
Private well	1	33	6	27	0	0	7
Unknown	0	0	3	14	0	0	3
TOTAL	3	100	22	100	5	100	30

5.) During the last year, has the water quality (appearance, taste, smell) at your residence changed?

Variable	Yes	%	No	%	Unk	%	TOTAL
City of Flint Water	10	100	2	11	1	100	13
City of Flint Township Water	0	0	3	16	0	0	3
Other municipal water system	0	0	4	21	0	0	4
Private well	0	0	7	37	0	0	7
Unknown	0	0	3	16	0	0	3
TOTAL	10	100	19	100	1	100	30

6.) Prior to your illness, did you make any recent plumbing changes or repairs at your residence?

Variable	Yes	%	No	%	Unk	%	TOTAL
City of Flint Water	1	33	11	44	1	50	13
City of Flint Township Water	0	0	3	12	0	0	3

### Working Case Definitions

Confirmed Legionnaires' Disease (LD) -- meets the CDC clinical and laboratory case definition for confirmed LD and illness occurred since June 1, 2014 in residents of Genesee County or those who had visited the Flint area in 2 weeks prior to their illness onset date.

Suspected LD -- meets the CDC clinical and laboratory case definition for suspected LD and illness occurred since June 1, 2014 in residents of Genesee County or those who had visited the Flint area in 2 weeks prior to their illness onset date.

### Data Sources

1. Legionellosis Case Report Form in Michigan Disease Surveillance System (MDSS)
2. Medical record review from:
  - a. Hospital A; Flint, MI
  - b. Hospital B; Flint, MI
  - c. Hospital C; Grand Blanc, MI
3. Patient interview using Genesee County-specific Legionellosis Questionnaire

### Epidemiology

Number of lab-confirmed cases of Legionnaires' Disease: 45

Geographic distribution:

44/45 Genesee County (27 Flint)

1/45 Saginaw County

Age range: 26-94 years

Average age (median): 62.1 years (63 years)

% Males: 51% (23/45)

Range of illness onset dates (n=45): 6/6/14-3/9/2015

Number (%) of deaths: 15.6% (7/45)

Number of cases interviewed: 29 completed + one partial (63% complete; 95.7% in total attempted/completed)

Number (%) of cases hospitalized: 45/45 (100%). Number in ICU: 22/45 (48.8%)

Number (%) of cases who had been hospitalized in 2-weeks prior to onset: 19/45 (37.8%)

Number (%) of cases with ≥1 co-morbidity: 25/29 interviewed (86%)

Number (%) of cases who are current or former smokers: 24/29 interviewed (83%)

6/4/2015 Page 2

## Epi Curves

### Five-year History

Legionellosis Cases by Month Reported —  
Genesee County, January 2010 — November 2015

Commented [WM(1)]: Suggested graphs. First, 5 year history  
15000, cases included in this report.

### Cases Analyzed in Current Report

This report summarizes data collected from the 45 confirmed legionellosis cases that occurred June 1, 2014 through March 31, 2015.

Commented [WM(2)]: Added sentence.

Legionellosis Cases by Estimated Symptom Onset Date —  
Genesee County, June 2014–March 2015 (n=45)

## Cases by Residence Water Source

Residence water source refers to the source of tap water at patient's home residence during the 14 days before symptom onset and was determined by patient interview and verified by City of Flint water distribution map.

Water Source at Residence	Total N=45	
	n	%
City of Flint water	21	47
City of Flint Township water	3	7
Other municipal water system	4	9
Private well	7	16
Unknown	10	22

## Healthcare Exposure

A person was defined as having a healthcare exposure if they visited a hospital or clinic in Flint, Michigan as an inpatient, outpatient, or visitor during the 14 days prior to their symptom onset date.

## Healthcare Exposure by Residence Water Source

	Total N=45		Healthcare exposure N=27		No known healthcare exposure N=18	
	n	%	n	%	n	%
City of Flint Water	21	47	13	48	8	44
Other water at residence	24	53	14	52	10	56

# Hospitalized Cases By Length of Stay and Residence Water Source

Commented [WM(3): OPTIMAL  
Do we stratify by HOSPITAL?

Location	Length of Stay*		
	N	Median (days)	Range
Hospital A	15	2	0.5-14
City of Flint water at patient residence	7	2	0.5-7
Other water at patient residence	8	5	1-14
Hospital B	2	1.5	1-2
City of Flint water at patient residence	1	1	
Other water at patient residence	1	2	
Hospital A and Hospital B; Residence on Flint water	1	5	
Hospital A		3	
Hospital B		2	
Total	19	3	0.5-14

\* Length of stay = Number of days hospitalized during 14 days prior to symptom onset date.

## Water Changes at Residence

### Question Prompts:

- Q4. During the last year, has the water pressure at your residence changed?
- Q5. During the last year, has the water quality (appearance, taste, smell) at your residence changed?
- Q6. Prior to your illness, did you make any recent plumbing changes or repairs at your residence?
- Q7. Prior to your illness, were there any water main breaks or other water line issues that affected the water at your residence, including boil water advisories?

	Flint Water at Residence (N=13)		Other Water Source at Residence (N=17)		Total (N=30)	
	n	%	n	%	n	%
Q4. Noticed changes in water pressure	2	15	1	6	3	10
Q5. Noticed changes in water quality	10	77	0	0	10	33
Q6. Made recent plumbing changes or repairs at residence	1	8	2	12	3	10
Q7. Experienced water main breaks or water line issues that affected residence	5	46	0	0	5	20

Commented [WM(4)]: Keep stratification by residential water

## Work and Travel

### Question Prompts:

- Q8. During this 2 week period (exposure period), did you work or volunteer, either full or part time?  
 Q10. Visit, reside, or work in a long term care facility, nursing home, assisted living facility, or senior living facility?  
 Q11. In the 2 weeks before you before you got sick, did you spend any nights away from home (excluding healthcare settings)?

	Total N=30	
	n	%
Q8. Work outside of the home	5	17
Contractor/painter		
Construction		
HR technician		
Industrial painter		
Welder		
Q8. Volunteer outside of the home	0	0
Q10. Reside or visit an assisted living facility or rehab facility	3*	10
Q11. Spend nights away from home	2**	7

\* Patients visited three different locations; none on City of Flint Water

\*\*Patients stayed in two different hotels outside of Flint and stayed ≤2 nights each.

## Community Exposures

Question prompt:

Q12. In the 2 weeks before you before you got sick ( \_\_\_\_\_ to \_\_\_\_\_ ), did you visit any of the following community venues?

	Total N = 29*	
	n	%
Hotel but did not stay overnight	0	0
Auditorium	1	3
Barbershop or Hair Salon	7	24
Car Wash	5	17
Casino	3	10
Place of Worship	8	28
Gym or Work-out Facility	1	4

### Case Flow-chart

### Epi Curve

### Summary of Legionellosis Outbreak — Genesee County, June 2014–March 2015

From June 2014 to March 2015, 45 Legionnaires' disease (LD) cases including 7 deaths were reported in Genesee County, Michigan. The Michigan Department of Health and Human Services (MDHHS) assisted the Genesee County Health Department (GCHD) in the investigation.

Data were collected from patient medical record review, the Michigan Disease Surveillance System case report form, and interviews with case-patients or their proxies with an enhanced legionellosis questionnaire. In an attempt to identify community sources, case-patients or proxies were interviewed about travel, work, and locations visited during the 2 weeks prior to symptom onset (considered the incubation period for LD).

All 45 cases were laboratory confirmed by *Legionella* urinary antigen test; one sputum specimen was collected, which was *Legionella* culture negative. Median patient age was 62 years (range: 26–94); 23 (51%) were male. Illness onset dates ranged from June 6, 2014 to March 9, 2015 and peaked in August, 2014 with 10 cases. Multiple attempts by phone and letter were made to contact all case-patients; interviews using the enhanced questionnaire were completed on 30 of 45 (67%). Healthcare-associated LD was suspected for a subset of cases. Nineteen of the 45 (42%) patients were hospitalized during the 2 weeks prior to symptom onset. Of those, 16 (84%) were hospitalized at hospital A, 2 (11%) at hospital B, and 1 (5%) at hospitals A and B. One patient was hospitalized at hospital A during their entire 2-week exposure period. Eight additional persons were exposed to Flint hospitals as outpatients or visitors; 5 (63%) to hospital A, 2(25%) to hospital B, and 1 (15%) to hospitals A and B. In total, 23/45 (51%) patients were exposed to hospital A as an inpatient, outpatient, or visitor. On October 4, 2014, hospital A hyperchlorinated their water system and continues to monitor for *Legionella*.

The municipal water system was an additional suspected source. Twenty-one of 45 (47%) cases occurred in people whose residence received City of Flint water. The majority (10 of 13, 77%) of people interviewed who lived on Flint water reported changes in water quality; 6 of 13 (46%) experienced water main breaks or water line issues at or near their residence prior to illness. Of the 18 persons that did not report healthcare visits, 8 (44%) were exposed to Flint water at their home.

In other exposures, of 30 persons interviewed, 2 (7%) stayed overnight in 2 different hotels, 2 (7%) were exposed to hot tubs and 20 (67%) visited  $\geq 1$  grocery store. All locations mentioned were visited by  $\leq 2$  patients with the exception of one grocery store outside of Flint that was visited by 5 patients.

Ten cases had no exposure to a Flint hospital in the 2 weeks prior to illness nor were their homes on the Flint water system. Of those, 3 people might have been exposed to Flint water at a grocery store or motel. Additionally, 1 person reported exposure to stagnant water as an industrial painter and one person was hospitalized at hospital A for 10 days immediately prior to their exposure period. The remaining 5 cases have no known exposure to Flint water, healthcare, or travel.

The outbreak is over; the last reported case occurred in March, 2015. The lack of clinical *Legionella* isolates precludes our ability to link cases to an environmental source. As epidemiologic data did not indicate a common community source, we cannot recommend environmental testing or additional patient/proxy interviews. As we enter the summer season, MDHHS recommends vigilant legionellosis awareness and surveillance in Genesee County, including interviewing of cases or proxies with the enhanced legionellosis questionnaire within one week of reporting. MDHHS also recommends the clinical community assist in LD surveillance through accurate identification, testing, and reporting of all suspect cases. Obtaining respiratory specimens in addition to urinary antigen testing is of critical importance in these increased surveillance efforts. Because *Legionella* spp. are commonly found in the environment, clinical isolates are necessary to interpret the findings of an environmental investigation in an outbreak. To assist, MDHHS has prepared updated legionellosis guidance to be distributed to health care providers via the Michigan Health Alert Network.

## Working Case Definitions

Confirmed Legionnaires' Disease (LD) – meets the CDC clinical and laboratory case definition for confirmed LD and illness occurred since June 1, 2014 in residents of Genesee County or those who had visited the Flint area in 2 weeks prior to their illness onset date.

Suspected LD – meets the CDC clinical and laboratory case definition for suspected LD and illness occurred since June 1, 2014 in residents of Genesee County or those who had visited the Flint area in 2 weeks prior to their illness onset date.

Confirmed Pontiac Fever (PF) – meets the CDC clinical and laboratory case definition for confirmed PF and illness occurred since June 1, 2014 in residents of Genesee County or those who had visited the Flint area in 2 weeks prior to their illness onset date.

## Data Sources

1. Legionellosis Case Report Form in Michigan Disease Surveillance System (MDSS)
2. Medical record review from:
  - a. McLaren Medical Center; Flint, MI
  - b. Hurley Medical Center; Flint, MI
  - c. Genesys Regional Medical Center; Grand Blanc, MI
3. Patient interview using Genesee County-specific Legionellosis Questionnaire

## Epidemiology

Number of lab-confirmed cases of Legionnaires' Disease: 45

Number of Pontiac fever cases: 1 with positive Ag test but asymptomatic (not included in analysis)

Geographic distribution:

**PHI**

Age range: 26-94 years

Average age (median): 62.1 years (63 years)

% Males: 51% (23/45)

Range of illness onset dates (n=45): **PHI**

Number (%) of deaths: 15.6% (7/45)

Date outbreak-specific survey completed and approved for use: 2/23/15

Number of cases interviewed: 29 completed + one partial (63% complete; 95.7% in total attempted/completed)

MDHHS: 19 completed / 30 contacted Genesee: 10 completed / 15 (1 status unknown)

Number (%) of cases hospitalized: 45/46 (97.8%). Number in ICU: 22/45 (48.8%)

Number (%) of cases hospitalized at McLaren: 18/45 (40%)

Number (%) of cases hospitalized at Hurley: 14/45 (31%)

Number (%) of cases hospitalized at Genesys: 6/45 (13.3%)

Number (%) of cases hospitalized at other hospitals outside Flint: 7/45 (15.6%)

Number (%) of cases who had been hospitalized in 2-weeks prior to onset: 19/45 (37.8%)

Number (%) of cases who had only a short-term visit to a hospital/healthcare facility in 2-weeks prior to onset: 8/45 (17.8%)

Number (%) of cases who had been hospitalized or who had a short-term visit to a hospital/healthcare facility in 2-weeks prior to onset: 27/45 (60%)

Number (%) of cases who work outside the home: 8/46 (17.4%) [min of 72% were at home]

Number (%) of cases who are retired: 20 (43.5%)

## Cases with No Known Healthcare Exposure and Residence not on Flint Water Supply

### Case Flow-chart

### Epi Curve

## Map of Community Exposures

We mapped the community locations visited by the 10 cases with unknown exposures (no known healthcare exposure and do not reside on Flint water supply) during the 14 days prior to symptom onset. Pins are color-coded by case. With exception of 2 grocery stores, none of the cases reported visiting the same locations. The majority of community locations were located outside of Flint or in Flint but were not supplied by City of Flint water.

*Same map, zoomed in*

## Potential Exposures

Epi Info Case ID	Symptom Onset Date	Exposure	Notes
3	PHI	Potential occupational	48-year-old male who is a painter and works inside of large industrial tanks with exposure to misty water. He reports wearing an air hood and using an air compressor. He cleaned a tank containing stagnant water 8 days prior to illness onset
16		Unknown	47-year-old female who did not report any healthcare visits or community exposures to locations supplied by Flint water.
15		Potential community (Flint water)	68-year-old male who reported visiting Flint grocery store that is supplied by City of Flint water. He spent 2 nights at hotel outside of Flint during exposure period.
32		Potential community (Flint water)	Not interviewed with Legionellosis questionnaire. While hospitalized, 31-year-old female reported staying in a Flint motel, which is supplied by City of Flint water, during her exposure period.
10		Unknown	48-year-old male who works as a welder and lives in a trailer park community with his 65 year old mother, who also had a positive Legionella urinary antigen test but was asymptomatic. The mother was tested while son was hospitalized.
36		Unknown	Not interviewed
20		Potential Healthcare	69-year-old female who was hospitalized 10 days for cancer treatment at McLaren and discharged the day before her exposure period began.
38		Unknown	Not interviewed
18		Potential community (Flint water)	48 year old male who visited two Flint grocery stores that are supplied by City of Flint water. Had a outpatient visit to a Clinic that borders Flint water
22		Unknown	62 year old male with no reported exposures to locations on Flint water.

## Summary of December and January Cases

Cases with unknown exposure may represent sporadic cases; however, cases in December and January are rare. The table below summarizes the 4 cases with symptom onset during December 2014–January 2015 that did not report a healthcare exposure or residence on Flint water supply.

Epi Info Case ID	Age (years), Sex	Symptom onset date	Legionellosis diagnosis date	Medical History	History of Smoking and Alcohol use	Notes
20	69, F	[REDACTED]	[REDACTED]	Metastatic ovarian cancer, recently diagnosed [REDACTED] PHI	Quit smoking 20 years ago (smoked for 30 years); Does not drink	Patient was hospitalized in McLaren for whole brain radiation [REDACTED] PHI (prior to exposure period). Patient died.
38	71, M			Diabetes, prostate cancer, hypertension	Denied smoking and alcohol use	Not interviewed.
18	48, M			COPD, CAD [REDACTED]	Smoker (1 pack per day for >35 years); Chronic alcohol abuse	Patient reports visiting two Flint grocery stores that are supplied by City of Flint water. He had an outpatient visit to a practice that is not on Flint water. He is unemployed.
22	62, M			Diffuse large cell [REDACTED] PHI [REDACTED] PHI that relapsed [REDACTED] PHI transplant in last year but not on immunosuppressive meds at time of symptom onset.	Smoker (60-80 pack year history for 35 years); 1–2 drinks per week	No reported exposures to Flint water in community. Patient spent one night at hotel outside of Flint during exposure period.

July - Brief on *Legionella*

Re: Efforts to assist

Illness. Analysis

Sept 28, 2015

Update on Legionellosis cases — PHI Summer, 2015

Current Case Count

- 39 cases reported since 6/1/2015 (38 Legionnaires disease, 1 Pontiac Fever)
- 20 (51%) male; median age 65 years (range 35–89 years)
- 39 patients were hospitalized; 2 deaths
- 11 respiratory specimens are at BQI awaiting PFGE

Based on the previous analysis given below on 31 cases as of Sept 4, 2015

- We continue to see subclustering with previous hospital exposure to McLaren Flint (58%). Cases are said to be clustered on several floors of one tower (to be confirmed)
- 29% have reported no prior hospitalization during their incubation period
- 13% prior hospitalization status unknown

Actions McLaren Flint has taken/is taking (filtered through GCHD)

- Hospital has been testing monthly at various locations since Fall of 2014
- McLaren is now working with a consultant, The Legionella Experts, Special Pathogens Lab, headed up by Dr Janet Stout, University of Pittsburgh, Swanson School of Engineering
- Hospital has been hyperchlorinating since last fall, but recently switched to monochloramine
- Upgrades have been made to the infrastructure (details unknown)
- McLaren is preemptively treating symptomatic patients who have been previously hospitalized in 2-week period prior to onset
- Staff receiving additional education about Legionella
- Using bottled water

Sept 28, 2015

- Monitoring water temperatures
- Communication is now with Risk Management team

#### MDHHS Activities

- Continue to monitor case counts
- MDHHS staff attended a BugFuzz meeting Sept 11 with GCHD & hospitals
- MDHHS meeting planned with just McLaren and Genesee County Health Department shortly (as soon as Genesee can confirm at meeting) to learn specifics about the remedial work McLaren and the consultant are conducting
- Conference call planned with GCHD & hospitals

\*\*\*\*\*

Previous analysis of 31 cases as of Sept 4, 2015 (M Weinberg)

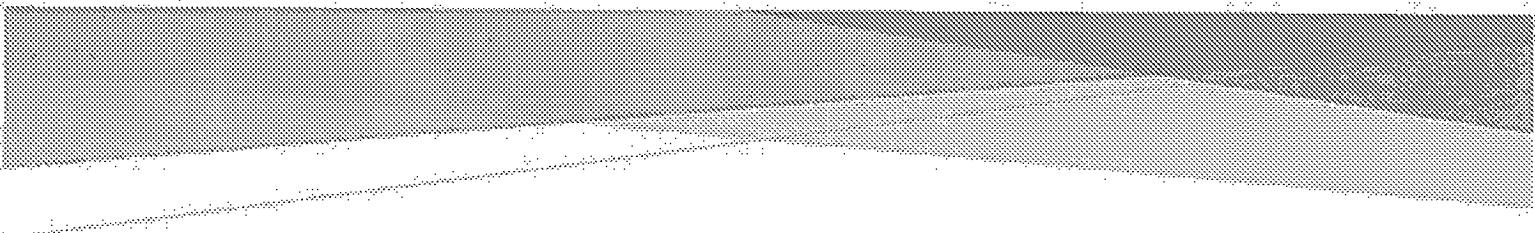

5-year History of Confirmed Legionellosis Cases in PHI from June–August

	June	July	August	TOTAL (Jun-Aug)
2015	10	11	9	30
2014	6	5	10	21
2013	1	0	2	3
2012	2	1	4	7
2011	0	1	0	1
2009	1	1	2	4

- Previous hospitalization status (based on questionnaire and MDSS notes)
  - 18/31 (58%) were hospitalized within 2 weeks prior to current admission
    - 16 at McLaren

- 1 at McLaren (5 days) and UofM (5 days)
  - 1 at McLaren (9 days) and Hurley (1 day)
  - 9/31 (29%) denied any hospitalizations 2 weeks prior to current admission
  - 4/31 (13%) with unknown previous hospitalization status. Of those,
    - 1 person previously hospitalized at Hurley, unknown dates
    - 1 person previously hospitalized at unknown location, unknown dates
    - 1 person was in McLaren ER for 2 hours
    - 1 person (Pontiac Fever case) was not interviewed
  - Note: I have not looked at outpatient visits or visits to hospitals as visitors.
- Lab results:
  - 31 (100%) were Legionella Urinary Antigen positive
  - 5 (16%) were culture confirmed; all *L. pneumophila* SG1.
  - Symptom onset dates of culture confirmed cases are [PHI]
  - Among the culture-confirmed,
    - 1 patient was hospitalized for 6 days at McLaren. Symptom onset began 8 days after discharge.
    - 2 patients deny hospitalization 2 weeks prior to onset.
    - 2 patients have an unknown hospitalization status.
- Additional risk factors based on enhanced Legionellosis questionnaire
  - 26/31 (84%) were interviewed
  - 19/26 (73%) report NOT receiving City of Flint water at residence
  - 4/26 (15%) report overnight travel 2 weeks prior to symptom onset
    - 1 person in Genesee County Jail for 2 nights
    - 1 person stayed at private cabin in Hubbard Lake
    - 1 person stayed at St. Ignace hotel for 1 night
    - 1 person stayed at an RV resort in Durand, MI for 1 night
  - 2/26 (8%) report hot tub use
    - 1 person used hot tub at St. Ignace hotel
    - 1 person reports daily hot-tub use
  - Note: I have not looked at the remaining potential community exposures (ie: grocery stores, salons, recreational water use, etc).

## Legionellosis Outbreak — Genesee County, May 2015–November 2015

### Summary

From May 2015 to November 2015, 42 legionellosis cases, all confirmed Legionnaires' disease (LD), were reported in Genesee County, Michigan. Four of these cases have died. The Michigan Department of Health and Human Services (MDHHS) assisted the Genesee County Health Department (GCHD) during their investigation.

Data were collected from patient medical record review, the Michigan Disease Surveillance System case report form, and interviews with case-patients or their proxies with an enhanced legionellosis questionnaire. In an attempt to identify community sources, case-patients or proxies were interviewed about travel, work, and locations visited during the 2 weeks prior to symptom onset (considered the incubation period for LD).

Median patient age was 65.5 years (range: 35–89); 22 (52%) were male. Illness onset dates ranged from [PHI] and peaked in July and August with 11 cases in both months. Case-patients were interviewed by GCHD using an enhanced questionnaire; interviews were conducted for 39 of 42 (93%) cases.

All 42 cases were laboratory confirmed by *Legionella* urinary antigen test. Eleven respiratory specimens were submitted for culture to the MDHHS Bureau of laboratories for pulsed-field gel electrophoresis (PFGE) testing. Three samples were unsuitable for typing due to lack of culture growth or mold contamination. PFGE typing was completed on eight samples; 2 samples had matching PFGE patterns, while 6 had unique patterns.

Healthcare-associated LD was suspected for a subset of cases. Over half of the cases (23/42) had an inpatient (overnight) healthcare facility exposure in the two weeks prior to their illness onset (22 of these were hospitalized at the same healthcare facility). Short-term hospital exposure data, such as outpatient and hospital visits, for the current summary period are in the process of being evaluated.

The source of water at the primary residence was evaluated for all cases. Ten of 42 (24%) cases occurred in people whose residence received City of Flint water. Of the 19 persons (45%) that did not have an inpatient (overnight) healthcare facility exposure in the two weeks prior to their illness onset, three (16%) had residences on the City of Flint water system. Sixteen of 42 cases (38%) had no inpatient (overnight) exposure to a Flint hospital in the 2 weeks prior to illness, nor were their residences on the City of Flint water system.

Questionnaire interview data are currently being evaluated for other potential common exposures. At this time, beyond the healthcare facility exposure, no other known community exposures have been identified as a potential source of infection.

Enhanced surveillance will continue in 2016. Although in recent months reports of legionellosis cases in Genesee County have declined, MDHHS has recommended continued vigilant legionellosis awareness and surveillance, including interviewing of cases or proxies with the enhanced legionellosis questionnaire within one week of reporting. MDHHS also recommends the assistance of clinical community in LD surveillance through identification, testing, and reporting of all suspect cases. Obtaining respiratory specimens in addition to urinary antigen testing is of critical importance in these increased surveillance efforts. Because *Legionella* bacteria are commonly found in the environment, clinical isolates are necessary to interpret the findings of an environmental investigation in an outbreak. MDHHS has distributed updated legionellosis guidance to health care providers via the Michigan Health Alert Network.

## Working Case Definitions

Confirmed Legionnaires' Disease (LD) – meets the CDC clinical and laboratory case definition for confirmed LD and illness occurred since May 1, 2015 in residents of Genesee County or those who had visited the Flint area in 2 weeks prior to their illness onset date.

## Data Sources

1. Legionellosis Case Report Form in Michigan Disease Surveillance System (MDSS)
2. Medical record review from:
  - a. Hospital A; Flint, MI
  - b. Hospital B; Flint, MI
  - c. Hospital C; Grand Blanc, MI
3. Patient interview using Genesee County-specific Legionellosis Questionnaire

## Epidemiology

Number of lab-confirmed cases of Legionnaires' disease: 42

Geographic distribution: 42/42 Genesee County (15/42 City of Flint)

Age:

Range: 35-89 years

Average age: 65.7 years

Median age: 65.5 years

Sex: Males, 22/42 (52.4%)

Range of illness onset dates (n=42): PHI

Deaths (note added 1/15/16):\* 4/42 (9.5%)

\*Death associated with legionellosis was defined as one that occurred during hospitalization, within 30 days of hospital discharge, or Legionella was listed as a cause of death on the death certificate.

(Ref. Mykietiuk A et al. Clin Infect Dis. 2005 Mar 15;40(6): 794-9.)

Cases interviewed: 39 (38 completed plus 1 partial interview) /42 (92.9%)

Cases hospitalized: 42/42 (100%)

Cases with an inpatient (overnight) hospital exposure in the 2 weeks prior to illness onset: 23/42 (54.8%)

Cases with  $\geq 1$  co-morbidity: 32/39 (82.1%)

Cases who are current or former smokers: 28/39 (71.8%)

## Epi Curves

### Five-year History

Note: If onset date was not available, referral date was used (i.e., date that the case was referred to public health). Cases in 2014 include one non-Genesee County resident associated with the 2014 outbreak.

### Cases Analyzed in Current Report

This report summarizes data collected from 42 confirmed legionellosis cases that were reported May, 2015 through November, 2015. The final case included in the analysis had an illness onset at the end of October, but was reported the beginning of November.

## Residence Water Source

Residence water source refers to the source of tap water at a patient's home residence during the 14 days before symptom onset and was determined by patient interview and verified by City of Flint water distribution map. Of the 42 cases, one case had exposure to both a private well and other municipal source during the 14 days prior to onset, accounting for the increase in the total (n = 43) in the table below.

Water Source at Residence	Total n = 43	
	n	%
City of Flint water	10	23.3
City of Flint Township water	0	0.0
Other municipal water system	14	32.6
Private well	17	39.5
Unknown*	2	4.7

\*Represents two questionnaires that were not completed. Per the water distribution map, neither of these residences is on the City of Flint water system; it is unknown if the residence water sources were private wells or other municipal systems.

## Inpatient Healthcare Exposure

A case was defined as having an inpatient healthcare exposure if they stayed overnight at Hospital A, B, or C in the Flint, Michigan area. Short-term exposures, such as outpatient and hospital visits, for the current summary period are in the process of being evaluated.

### Inpatient Healthcare Exposure by Residence Water Source

	Total n = 42		Inpatient healthcare exposure n = 23		No known inpatient healthcare exposure n = 19	
	n	%	n	%	n	%
City of Flint Water	10	23.8	7	30.4	3	15.8
Other water at residence	32	76.2	16*	69.6	16	84.2

\*One person who spent significant time at a hospital, but did not stay overnight, was included in the inpatient healthcare exposure category and calculations.

## Prior Inpatient Hospitalization by Length of Stay and Residence Water Source

Location	n	Length of Stay	
		Median (days)	Range
Hospital A*	21	5	1–10
City of Flint water at patient residence	6	9	1–9
Other water at patient residence	15	4	1–10
Hospital A and Hospital C (residence on Flint water)	1		
Hospital A		1	
Hospital C		6	
Total	22**	5	1–10

Note: Length of stay = Number of days hospitalized during 14 days prior to symptom onset date.

\*One person was also an inpatient at a hospital outside of Genesee County for 11 days during the 14 days prior to symptom onset date.

\*\*The person who spent significant time at a hospital, but did not stay overnight, was excluded from the length of stay calculation.

## Enhanced Questionnaire Data

### Water Changes at Residence

#### Question Prompts:

Q4. During the last year, has the water pressure at your residence changed?

Q5. During the last year, has the water quality (appearance, taste, smell) at your residence changed?

Q6. Prior to your illness, did you make any recent plumbing changes or repairs at your residence?

Q7. Prior to your illness, were there any water main breaks or other water line issues that affected the water at your residence, including boil water advisories?

		City of Flint Water at Residence n = 9		Other Water Source at Residence n = 30		Total n = 39	
		n	%	n	%	n	%
Q4. Noticed changes in water pressure	Yes	2	22.2	6	20.0	8	20.5
	No	4	44.4	23	76.7	27	69.2
	Unknown	3	33.3	1	3.3	4	10.3
Q5. Noticed changes in water quality	Yes	7	77.8	5	16.7	12	30.7
	No	1	11.1	23	76.7	24	61.5
	Unknown	1	11.1	2	6.7	3	7.7
Q6. Made recent plumbing changes or repairs at residence	Yes	0	0.0	0	0.0	0	0.0
	No	9	100	30	100	39	100
	Unknown	0	0.0	0	0.0	0	0.0
Q7. Experienced water main breaks or water line issues that affected residence	Yes	1	11.1	1	3.3	2	5.1
	No	8	88.9	26	86.7	34	87.2
	Unknown	0	0.0	3	10.0	3	7.7

## Work and Travel

### Question Prompts:

- Q8. During this 2 week period (exposure period), did you work or volunteer, either full or part time?
- Q10. Visit, reside, or work in a long term care facility, nursing home, assisted living facility, or senior living facility?
- Q11. In the 2 weeks before you before you got sick, did you spend any nights away from home (excluding healthcare settings)?

	Total n = 39	
	n	%
Q8. Work outside of the home	8	20.5
Auto factory worker		
Bank teller		
Communications company worker		
Community health coach		
Construction company office worker		
Line worker		
Train engineer		
Yard worker/landscaper		
Q8. Volunteer outside of the home	0	0.0
Q10. Reside or visit an assisted living facility or rehab facility	3	7.7
Q11. Spend nights away from home	4	10.3

## Community Exposures

Question prompt:

Q12. In the 2 weeks before you before you got sick, did you visit any of the following community venues?

	Total n = 38*	
	n	%
Hotel but did not stay overnight	1	2.6
Auditorium	1	2.6
Barbershop or Hair Salon	9	23.7
Car Wash	2	5.3
Casino	0	0.0
Place of Worship	11	28.9
Gym or Work-out Facility	2	5.3
Grocery	25	65.8
Home Improvement Store	9	23.7
Spa or Nail Salon	1	2.6
Mall or Department Store	4	10.5
Movie Theater	3	7.9

\*One person refused to answer this portion of the interview

## Water Exposures in the Home

Question prompt:

Q13. In the 2 weeks before you got sick, did you have exposure to any of the following water sources, either *at home* or while *away from home*?

	Total n = 38*	
	n	%
Shower	35	92.1
Use a detachable shower head or hose	18	47.4
Hot tub, whirlpool spa, Jacuzzi tub	2	5.3
Sat NEAR hot tub or whirlpool spa	0	0.0
Steam room or wet sauna	0	0.0
Humidifier	6	15.8
Respiratory therapy machine	3	7.9

\*One person refused to answer this portion of the interview

### Water Exposures Outside of the Home

	Total n = 38*	
	n	%
Showered outside the home	6	15.8
Use a detachable shower head or hose	4	10.5
Hot tub, whirlpool spa, Jacuzzi tub	1	2.6
Sat NEAR hot tub or whirlpool spa	0	0.0
Humidifier	0	0.0
Pool/splash pad/waterpark	1	2.6
Recreational or cooling misters	2	5.3
Steam room or wet sauna	0	0.0
Decorative fountain	0	0.0
Outdoor watering hose or sprinkler	6	15.8
Beach, lake, pond, river, creek	1	2.6

\*One person refused to answer this portion of the interview

### Patient or Proxy Reported Comorbidities

	Total n = 39	
	n	%
≥1 comorbidity	32	82.1
Chronic kidney disease	7	17.9
Immunocompromised	8	20.5
Diabetes	15	38.5
Chronic lung disease	7	17.9
Asthma or chronic bronchitis	6	15.4
Heart disease or congestive heart failure	25	64.1
Liver disease	1	2.6

## Patient or Proxy Reported Health Behaviors

	Total n = 39	
	n	%
<b>Smoking Status</b>		
Never smoker	10	25.6
Current smoker	11	28.2
Former smoker	17	43.6
Lives with smoker	1	2.6
<b>Drinks alcohol</b>		
Yes	13	33.3
No	18	46.2
Not specified	8	20.5

## Laboratory Testing

	Total n = 42	
	n	%
<b>Urinary Antigen Positive</b>	42	100
<b>Sputum Culture Positive</b>		
Yes ( <i>Legionella pneumophila</i> – serogroup 1)	8	19.0
No	5	11.9
Specimen culture not collected	29	69.0
<b>PFGE Match</b>		
Yes	2	4.8
No	6	14.3
PFGE not performed due to lack of culture/isolate, or negative culture	34	81.0

## PFGE Testing Summary

Number of legionellosis cases with PFGE performed: 8

Geographic residence distribution: 3 Flint, 3 Burton, 1 Mount Morris, 1 Grand Blanc

Age range: 45-85 years

Average age (median): 60.3 years (56 years)

Sex: Males, 50% (4/8)

Number of (%) cases interviewed: 6 completed + one partial (75% complete)

-6/8 specimens had unique patterns:

Onset	Hospitalization within 2 weeks prior to onset?	Residence on City of Flint water?
<b>PHI</b>	No	No
	No	No
	No	No
	No	No
	Yes- Hospital A & Hospital C	Yes
	No	No

-2/8 specimens had matching patterns:

Onset	Hospitalizations within 2 weeks prior to onset?	Residence on City of Flint water?
<b>PHI</b>	Yes- Hospital A	No
	No	No

## Cases with No Known Healthcare Exposure and Residence not on Flint Water Supply

### Case Flow-chart

## Summary

From [PHI] 45 legionellosis cases, all confirmed Legionnaires' disease (LD), were reported in Genesee County, Michigan. Seven of these cases have died; one death was attributable to *Legionella* pneumonia. The Michigan Department of Health and Human Services (MDHHS) assisted the Genesee County Health Department (GCHD) in the investigation.

Data were collected from patient medical record review, the Michigan Disease Surveillance System case report form, and interviews with case-patients or their proxies with an enhanced legionellosis questionnaire. In an attempt to identify community sources, case-patients or proxies were interviewed about travel, work, and locations visited during the 2 weeks prior to symptom onset (considered the incubation period for LD).

All 45 cases were laboratory confirmed by *Legionella* urinary antigen test; one sputum specimen was collected, which was *Legionella* culture negative. Median patient age was 62 years (range: 26–94); 23 (51%) were male. Illness onset dates ranged from [PHI] and peaked in [PHI] with 10 cases. Multiple attempts by phone and letter were made to contact all case-patients; interviews using the enhanced questionnaire were completed on 30 of 45 (67%).

Healthcare-associated LD was suspected for a subset of cases. Results demonstrated that over half (27/45) of the cases had a healthcare facility exposure in the two weeks prior to their illness onset (23 were hospitalized at or had visited the same healthcare facility). In response, the healthcare facility has implemented multiple environmental and procedural measures to alleviate the situation.

The source of water at the primary residence was evaluated for all cases. Twenty-one of 45 (47%) cases occurred in people whose residence received City of Flint water. Of the 18 persons that did not report healthcare visits, 8 (44%) were exposed to Flint water at their home.

Ten cases had no exposure to a Flint hospital in the 2 weeks prior to illness nor were their homes on the Flint water system.

Other possible exposures were evaluated and no other known community exposures were identified.

Enhanced surveillance has continued for the remainder of 2015. All cases reported in 2015 will be summarized at year end. The lack of clinical *Legionella* isolates during the time period described in this summary precludes our ability to link cases to an environmental source. MDHHS has recommended vigilant legionellosis awareness and surveillance in Genesee County, including interviewing of cases or proxies with the enhanced legionellosis questionnaire within one week of reporting. MDHHS also recommends the clinical community assist in LD surveillance through accurate identification, testing, and reporting of all suspect cases. Obtaining respiratory specimens in addition to urinary antigen testing is of critical importance in these increased surveillance efforts. Because *Legionella* spp. are commonly found in the environment, clinical isolates are necessary to interpret the findings of an environmental investigation in an outbreak. To assist, MDHHS prepared updated legionellosis guidance to be distributed to health care providers via the Michigan Health Alert Network.

## Working Case Definitions

**Confirmed Legionnaires' Disease (LD)** – meets the CDC clinical and laboratory case definition for confirmed LD and illness occurred since June 1, 2014 in residents of Genesee County or those who had visited the Flint area in 2 weeks prior to their illness onset date.

**Suspected LD** – meets the CDC clinical and laboratory case definition for suspected LD and illness occurred since June 1, 2014 in residents of Genesee County or those who had visited the Flint area in 2 weeks prior to their illness onset date.

## Data Sources

1. Legionellosis Case Report Form in Michigan Disease Surveillance System (MDSS)
2. Medical record review from:
  - a. Hospital A; Flint, MI
  - b. Hospital B; Flint, MI
  - c. Hospital C; Grand Blanc, MI
3. Patient interview using Genesee County-specific Legionellosis Questionnaire

## Epidemiology

Number of lab-confirmed cases of Legionnaires' disease: 45

Geographic distribution:

PHI

Age range: 26-94 years

Average age (median): 62.1 years (63 years)

% Males: 51% (23/45)

Range of illness onset dates (n=45): PHI 9 mo.

Number (%) of deaths: 15.6% (7/45)  $5/45 = 11.1\%$

Number of cases interviewed: 29 completed + one partial (63% complete; 95.7% in total attempted/completed)

Number (%) of cases hospitalized: 45/45 (100%). Number in ICU: 22/45 (48.8%)

Number (%) of cases who had been hospitalized in 2-weeks prior to onset: 19/45 (37.8%)

Number (%) of cases with  $\geq 1$  co-morbidity: 25/29 interviewed (86%)

Number (%) of cases who are current or former smokers: 24/29 interviewed (83%)

## Epi Curves

### Five-year History

### Cases Analyzed in Current Report

This report summarizes data collected from the 45 confirmed legionellosis cases that occurred June 1, 2014 through March 31, 2015.

## Cases by Residence Water Source

Residence water source refers to the source of tap water at patient's home residence during the 14 days before symptom onset and was determined by patient interview and verified by City of Flint water distribution map.

Water Source at Residence	Total N=45	
	n	%
City of Flint water	21	47
City of Flint Township water	3	7
Other municipal water system	4	9
Private well	7	16
Unknown	10	22

## Healthcare Exposure

A person was defined as having a healthcare exposure if they visited a hospital or clinic in Flint, Michigan as an inpatient, outpatient, or visitor during the 14 days prior to their symptom onset date.

## Healthcare Exposure by Residence Water Source

	Total N=45		Healthcare exposure N=27		No known healthcare exposure N=18	
	n	%	n	%	n	%
City of Flint Water	21	47	13	48	8	44
Other water at residence	24	53	14	52	10	56

## Hospitalized Cases By Length of Stay and Residence Water Source

Location	Length of Stay*		
	N	Median (days)	Range
Hospital A	16	2	0.5-14
City of Flint water at patient residence	7	2	0.5-7
Other water at patient residence	9	5	1-14
Hospital B	2	1.5	1-2
City of Flint water at patient residence	1	1	
Other water at patient residence	1	2	
Hospital A and Hospital B; Residence on Flint water	1	5	
Hospital A		3	
Hospital B		2	
Total	19	3	0.5-14

\* Length of stay = Number of days hospitalized during 14 days prior to symptom onset date.

## Water Changes at Residence

### Question Prompts:

Q4. During the last year, has the water pressure at your residence changed?

Q5. During the last year, has the water quality (appearance, taste, smell) at your residence changed?

Q6. Prior to your illness, did you make any recent plumbing changes or repairs at your residence?

Q7. Prior to your illness, were there any water main breaks or other water line issues that affected the water at your residence, including boil water advisories?

	Flint Water at Residence (N=13)		Other Water Source at Residence (N=17)		Total (N=30)	
	n	%	n	%	n	%
Q4. Noticed changes in water pressure	2	15	1	6	3	10
Q5. Noticed changes in water quality	10	77	0	0	10	33
Q6. Made recent plumbing changes or repairs at residence	1	8	2	12	3	10
Q7. Experienced water main breaks or water line issues that affected residence	6	46	0	0	6	20

## Work and Travel

### Question Prompts:

- Q8. During this 2 week period (exposure period), did you work or volunteer, either full or part time?
- Q10. Visit, reside, or work in a long term care facility, nursing home, assisted living facility, or senior living facility?
- Q11. In the 2 weeks before you before you got sick, did you spend any nights away from home (excluding healthcare settings)?

	Total N=30	
	n	%
Q8. Work outside of the home	5	17
Contractor/painter		
Construction		
HR technician		
Industrial painter		
Welder		
Q8. Volunteer outside of the home	0	0
Q10. Reside or visit an assisted living facility or rehab facility	3*	10
Q11. Spend nights away from home	2**	7

\* Patients visited three different locations; none on City of Flint Water

\*\*Patients stayed in two different hotels outside of Flint and stayed ≤2 nights each.

## Community Exposures

Question prompt:

Q12. In the 2 weeks before you before you got sick (\_\_\_\_\_to \_\_\_\_\_), did you visit any of the following community venues?

	Total N = 29*	
	n	%
Hotel but did not stay overnight	0	0
Auditorium	1	3
Barbershop or Hair Salon	7	24
Car Wash	5	17
Casino	3	10

## MDHHS Talking Points

## 2014-2015 Genesee County Health Department Legionellosis Public Health Investigation

Legionellosis Background:

*Legionella* is a type of bacteria found naturally in fresh water environments. This bacteria grows best in warm water, like the kind found in hot tubs, cooling towers, hot water tanks, potable water systems, and decorative fountains. When people are exposed to the bacteria, it can cause illness. Legionellosis is a respiratory disease caused by *Legionella* bacteria. Sometimes the bacteria infect the lungs and cause pneumonia, called Legionnaires' disease. The bacteria can also cause a less serious infection that presents more like a mild case of the flu; this form of legionellosis is called Pontiac fever. People are exposed to *Legionella* when they breathe in a mist or vapor containing the bacteria.

*Legionella* cannot spread from one person to another person. Most people exposed to the bacteria do not become ill. People at higher risk of getting sick include: individuals over 50 years old; current or former smokers; those with chronic lung disease; people with a weakened immune system from diseases like cancer, diabetes, or kidney failure; and individuals who take medications that weaken the immune system, such as steroids or chemotherapy. Cases of legionellosis are most common during the late spring through early fall.

Timeline of MDHHS Assistance to GCHD:

- Fall 2014
  - DHHS increased surveillance of GCHD legionellosis cases, requested need for clinical specimens, and offered assistance to GCHD re environmental testing
  - Created a comprehensive linelist of cases
  - Offered to help with creating a questionnaire
- Jan 23, 2015 Email from Jim Collins officially offering our assistance to GCHD and request for conference call
- Jan 27, 2015 Call with GCHD -- identified gaps in investigation that need to be addressed (need for questionnaire to reinterview cases, continued request for clinical specimens, get complete epi data on cases, map cases, and areas in which MDCH could offer of assistance)
- Jan 28, 2015 Call with hospitals and DEQ at Hurley's request
- Feb 11, 2015 - DHHS provided Legionellosis Guidance for Clinicians to be included with HAN to providers (GCHD sent email not HAN on Feb 13 to hospitals only)
- Feb 13-20, 2015 - Finalized an outbreak-specific *Legionella* questionnaire to be administered to all cases
- Feb 19, 2015 - Call with GCHD to discuss questionnaire and investigation
- Feb-May 2015-DHHS Team of four conducted interviews with patients

- Conducted medical chart reviews on all cases (June 2014 – March 2015) to complete epi data. Obtained death certificates for deceased cases
- Updated MDSS case records
- DHHS mapped cases on Flint water system map

April 7, 2015 DHHS & DEQ call with GCHD to discuss investigation progress and to wrap up interviewing. DHHS provided updated stats

April 14, 2015 DHHS met with DEQ

April 22, 2015 Call with CDC and GCHD

April 29, 2015 Finalized epi analysis from survey results. DEQ met with McLaren & Hurley to review HACCP programs re plumbing systems

April 30, 2015 Call with GCHD & CDC & call with DEQ

May 18, 2015 Provided updated clinical guidance to GCHD; drafted letter to be mailed out to cases not yet interviewed as a last call

June 4, 2015 Shared a copy of the epi summary of June 2014 – March 2015 cases with GCHD and hospitals

Sept 8, 2015 DHHS completed new analysis of 2015 cases since June. Lab testing of clinical specimens

Oct 22, 2015 Call with GCHD and assisted with data for Bug Fuzz meeting on Oct 23

### Analysis Highlights:

June, 2014- March, 2015:

- 45 cases of Legionnaires' disease (LD) including 7 deaths were reported in [PHI] Michigan.
- Median patient age was 62 years (range: 26–94); 23 (51%) cases were male.
- Illness onset dates ranged from [PHI] and peaked in [PHI] with 10 cases.
- 45/45 (100%) cases were laboratory confirmed by *Legionella* urinary antigen test; one sputum specimen was collected, which was *Legionella* culture negative.

Beginning at the end of February, 2015 enhanced data were collected from patient medical record review, the Michigan Disease Surveillance System case report form, and interviews with case-patients or their proxies with an extended/detailed legionellosis questionnaire that included questions regarding travel, work, and locations visited during the 2 weeks prior to symptom onset.

- 30/45 (67%) cases were able to be contacted and interviewed using the enhanced questionnaire

### Potential healthcare-associated cases

- 19/45 (42%) patients were hospitalized (admitted) during the 2 weeks prior to symptom onset. 16 (84%) were hospitalized at hospital A, 2 (11%) at hospital B, and 1 (5%) at hospitals A and B.
- 8 persons were exposed to Flint hospitals as outpatients or visitors; 5 (63%) to hospital A, 2 (25%) to hospital B, and 1 (15%) to hospitals A and B.

- In total, 23/45 (51%) patients were exposed to hospital A as an inpatient, outpatient, or visitor.
  - 10/4/14 Hospital A hyperchlorinated their water system and continued to monitor for *Legionella*
- Exposure to the municipal water system
- 21/45 (47%) cases occurred in people whose residence received City of Flint water.
    - 10/13 (77%) people interviewed who lived on Flint water reported changes in water quality
    - 6/13 (46%) experienced water main breaks or water line issues at or near their residence prior to illness.
  - 8/18 (44%) persons that did not report healthcare visits had Flint water at their home.
  - 10/45 (22%) cases had no exposure to a Flint hospital in the 2 weeks prior to illness and their homes were not on the Flint water system.

**May, 2015- November, 2015: (Preliminary data, the current season is still being evaluated and analyzed)**

- 42 cases of Legionellosis reported (41 Legionnaires disease, 1 Pontiac Fever) including 2 deaths.
- Median age 67 years (range 35–89 years); 22/42 (52%) male
- Illness onset dates ranged from [PHI] and peaked in July and August with 11 cases each month.
- 42/42 (100%) of patients were hospitalized for their illness
- 42/42 (100%) cases were Legionella Urinary Antigen positive
- 11 respiratory specimens were received at the MDHHS Bureau of Labs for culture/typing
  - 8/11 were culture confirmed; all *L. pneumophila* Serogroup 1
  - 3/11 specimens unsuitable for PFGE: 2 no growth, 1 specimen overgrown with mold
  - 8/11 specimens were able to have PFGE performed
    - 6/8 specimens had unique patterns; 0/8 had hospitalizations in 2 weeks prior to onset, 1/8 had City of Flint water at residence
    - 2/18 had matching PFGE patterns; 1/2 was hospitalized at Hosp A during 2 weeks prior to onset, 0/2 had City of Flint water at their residence
- 38/42 (90%) cases interviewed with supplemental questionnaire

Potential healthcare-associated cases

- 20/42 (48%) cases hospitalized (admitted) during the 2 weeks prior to onset
  - 19/20 (95%) were hospitalized at Hospital A in the 2 weeks prior to their onset
  - The last case with a hospitalization exposure to Hospital A during the 2 weeks prior to onset occurred in August
  - 1/20 (5%) was not hospitalized, but spent significant time at Hospital B during the 2 weeks prior to onset

- 22/42 (52%) cases have no prior hospitalization reported during the 2 weeks prior to onset
- Outpatient visits and visitations to hospitals are still being assessed for the current season.

Exposure to the municipal water system

- 10/42 (23%) cases occurred in people whose residence received City of Flint water.
  - 6/10 (60%) of cases with residence on the City of Flint water system also had a hospitalization at Hospital A during the 2 weeks prior to onset.
- 32/42 (76%) case residences NOT on the City of Flint water system
- 15/42 (36%) cases had no reported admissions to a Flint hospital in the 2 weeks prior to illness and their homes were not on the Flint water system.

**MDHHS recommendations from ongoing investigation:** Because *Legionella* spp. are commonly found in the environment, clinical isolates are necessary to interpret the findings of an environmental investigation in an outbreak. The small number of clinical *Legionella* isolates collected from patients hinders our ability to link cases to an environmental source as only 2/8 isolates match and no common exposure among those patients is known. As epidemiologic data did not indicate a common community source, locations for environmental testing have been unable to be determined. MDHHS recommends continued vigilant legionellosis awareness and surveillance in Genesee County, including immediate interviewing of cases or proxies with the enhanced legionellosis questionnaire within one week of reporting. MDHHS also recommended the clinical community assist in LD surveillance through accurate identification, testing, and reporting of all suspect cases. Obtaining respiratory specimens in addition to urinary antigen testing is of critical importance in these increased surveillance efforts.

## EXECUTIVE SUMMARY

Special Pathogens Laboratory (SPL) was contacted by McLaren Flint Health Care to assist the hospital in responding to an increase in the incidence of Legionnaires' disease due to *Legionella pneumophila*, serogroup 1. The Genesee County Health Department had also been in contact with the hospital regarding cases of Legionnaires' disease in patients that had been diagnosed and treated at the hospital. This increase in cases had been observed over the past year when water quality in Flint was adversely affected when the city switched from Detroit water to the Flint River last year.

SPL was asked to provide consultation services, including an on-site risk assessment, review of the facility's current Legionella policy, and development of a Water Safety Plan for the facility.

Assessments of McLaren Flint Hospital buildings were performed from August 11 – 13, 2015. The assessment including collection of samples for *Legionella* culture from distal hot water sites, distal cold water sites, hot water heaters, a hot water return, and the cold water entries. Physicochemical measurements, including pH, temperature, and free chlorine, were also taken.

*Legionella pneumophila* serogroup 1 was detected across all systems, with the majority of hot water distal sites (water outlets) showing some level of positivity.

McLaren Flint Hospital Administration, Infectious Diseases, Facilities Engineering and Infection Control acted aggressively to address the potential risk for hospital-acquired Legionnaires' disease. Staff worked with SPL to expedite both short and long-term approaches to prevention. This included recommendations for

rapid identification and treatment of cases as well as recommendations regarding options for installation of secondary water treatment (disinfection).

The hospital staff performed a "shock" hyperchlorination disinfection in Buildings F, A, and B/C. The hyperchlorination disinfection for Building F Upper System was completed on August 14-15, 2015 and re-sampled for *Legionella* on August 17, 2015.

The "post-disinfection" culture results showed that *Legionella* concentrations were significantly lower—indicating the hyperchlorination disinfection was a successful short-term remediation which temporarily reduced *Legionella*.

Long-term secondary disinfection with monochloramine was recommended in patient care areas because of its proven efficacy and ability to rapidly reduce *Legionella* in hospital hot water systems. A Water Safety Plan is being developed to provide on-going risk management and to comply with the new ASHRAE 188 *Legionella* standard.

These efforts have resulted in successfully reducing *Legionella* in the hospital water systems. No cases of healthcare-acquired Legionnaires' disease were identified following these measures.

# SPECIAL UPDATE

Over the past several weeks, there has been an increase in the number of Legionella cases throughout Genesee County. Although a clear source for this increase has not been specifically identified, McLaren Flint is taking proactive and precautionary measures to ensure that we are implementing all recommended practices and safety measures in the prevention and elimination of Legionella in the water system at our facility. In this initiative, we are working in partnership with the Genesee County Health Department and have engaged with leading experts in this field.

Beginning Friday, August 14, we are taking the following steps:

1. Adding additional chlorine to our water supply, while still maintaining levels well within safe drinking standards.
2. Providing bottled water for drinking while we are implementing specific measures. Patients will receive bottled water with all meals, and it will also be available on the unit throughout the day. Employees will also have access to bottled water for drinking purposes.
3. Implementing hyperchlorination of our water system to reinforce the routine, twice-a-year hyperchlorination process that was last implemented in April.
4. Continuing surveillance testing of our water to ensure consistent quality standards.

We understand these implementations may interrupt daily routines and appreciate your support as we work together to maintain a healthy environment for our patients, visitors and staff.

As additional resources, we are including with this update information outlining frequently asked questions and facts about Legionella.

***For any further information, please contact  
Infection Control at (810) 342-2290.***

# Frequently Asked Questions about Legionnaires' Disease

## What is Legionnaires' disease?

Legionnaires' disease is a lung infection (pneumonia) caused by a bacterium named *Legionella pneumophila*. The name *Legionella pneumophila* was derived from the original outbreak at the 1976 American Legion Convention in Philadelphia. *Pneumophila* means "lung loving" in Greek.

## Where do *Legionella* bacteria come from?

*Legionella* are natural inhabitants of water and can be detected in rivers, lakes, and streams. The bacteria are commonly found in the water systems of buildings and households, but pose little risk to healthy adults and children. One type of *Legionella* species (*L. longbeachae*) has been found in potting soil.

## What are the most common symptoms?

Legionnaires' disease can have symptoms like many other forms of pneumonia, so it can be hard to diagnose at first. Signs of the disease can include: a high fever, chills, cough, and confusion. Some people may also suffer from muscle aches and headaches. Symptoms usually begin two to 10 or 14 days after being exposed to the bacteria.

## Is Legionnaires' disease contagious?

Legionnaires' disease is not contagious. No special precautions, or isolation of the patient is necessary. The disease is transmitted via drinking water not by infected persons. It requires direct exposure to the bacteria -- usually by aerosolized water mist that is inhaled or aspiration.

## Who is at greatest risk for contracting Legionnaire's disease?

People at risk for contracting Legionnaires' disease following exposure to water that contains *Legionella* are usually 65 years or older, smokers, patients with chronic lung disease, and those with weakened immune systems. People who have had a bone marrow or solid organ transplant have the greatest risk of contracting *Legionella* pneumonia.

## How is Legionnaires' disease treated?

Many antibiotics are highly effective against *Legionella* bacteria. The two most effective antibiotics are levofloxacin and azithromycin.

## Legionella Facts

1. Legionnaires' disease is a form of bacterial pneumonia caused by the bacteria *Legionella* found in building water systems.
2. *Legionella* bacteria are naturally found in municipal cold water, but can grow in high numbers in warm water after entering a building's hot water system.
3. How much *Legionella* grows depends on the temperature. The ideal temperature range is between 95 and 110 degrees.
4. Brown water events and water pressure changes in pipes can increase *Legionella* in building water systems.
5. Legionnaires' disease causes a small percentage, only about 2 to 5% of the average 600,000 pneumonia cases that require hospitalization each year.
6. Even if the bacteria enter the lungs, either by inhalation or aspiration drinking water or water droplets, the majority of persons exposed won't become ill. The likelihood for illness is greatest for persons with chronic lung disease (smokers, COPD), those taking high dose steroids, diabetics, patients who have had transplants or persons with compromised immune systems, i.e., cancer treatments.
7. Not all antibiotics are effective against Legionnaires' disease. Two that are very effective are levofloxacin or azithromycin.
8. Diagnosis of Legionnaires' disease requires a specific test—urine antigen—which must be ordered by a physician. Cases are often missed when physicians don't consider Legionnaires' disease as a possible illness. It is often not diagnosed and is under reported for these reasons.
9. Rapid diagnosis and effective treatment are key to minimizing the severity of the disease and in preventing mortality.
10. Approaches to preventing exposure of at risk patient populations to *Legionella* bacteria in water include:
  - \* Using sterile water with equipment such as nasogastric and endotracheal tubes, TEE probes, etc.
  - \* Providing bottled water for drinking when cases of hospital-acquired Legionnaires' disease have been identified and until after water is treated to control *Legionella*.
  - \* Since there is no person-to-person spread of *Legionella* bacteria, disease prevention is accomplished by additional treatment of the warm water system to control and prevent the growth of *Legionella*.

**Date:** November 30, 2015  
**Release Date:** For Immediate Release **End Date:** ??????  
**Contact:** Name  
Title  
**Phone:** (810) 257-  
**Re:** Legionnaires Disease Increase in Genesee County

The Genesee County Health Department (GCHD) is reporting a significant increase in the number of legionellosis cases in Genesee County: 41 cases of legionellosis were reported in 2014 and 45 cases to date in 2015. From 2009 to 2013, an average of nine cases per year had been reported in Genesee County. Legionellosis is a respiratory infection caused by *Legionella* bacteria and can present as either Legionnaires' disease or as a milder illness called Pontiac fever. Legionnaires' disease symptoms include cough, shortness of breath, high fever, pneumonia, muscle aches, headaches, and sometimes diarrhea and abdominal pain. Pontiac fever has similar symptoms but does not progress to pneumonia. Symptoms usually occur 2 to 14 days after exposure to the bacteria. People who are most at risk of developing legionellosis are those who are older, smokers/former smokers, immunosuppressed, or who have other underlying or chronic health conditions. The incubation period (time from exposure to the onset of illness) ranges from 2 to 14 days. More illness is usually found in the summer and early fall, but it can happen any time of year.

*Legionella* bacteria are commonly found in the environment, usually in water. The bacteria grow best in warm water, such as the water found in hot tubs, cooling towers, hot water tanks, decorative fountains, and large plumbing systems. People are exposed to *Legionella* when they breathe in a mist or vapor that is contaminated with the bacteria. Legionnaires' disease is not spread from one person to another. One cannot become ill from drinking water containing *Legionella*.

A review has been completed on the 45 cases reported from June 2014 to March 2015. Seven of these cases have died with only one of those specifying a cause of death that was attributed to *Legionella* pneumonia. The median age of the cases was 62 years. The majority of cases had at least one underlying

medical condition. Results demonstrated that over half (27/45) of the cases had a healthcare facility exposure in the two weeks prior to their illness onset (23 were hospitalized at or had visited the same healthcare facility). In response, the healthcare facility has implemented multiple environmental and procedural measures to alleviate the situation.

GCHD has worked closely with the local medical centers to provide information about *Legionella* and clinical guidance about legionellosis infections. A fact sheet of Legionnaires' disease is posted on the GCHD website [GCHD, please provide link]. GCHD continues to conduct surveillance for legionellosis cases.

**Re:** Legionnaires Disease Increase in Genesee County

The Genesee County Health Department has been monitoring a significant increase in the number of Legionnaires cases observed in Genesee County during 2014 and 2015. During calendar year 2014, there were 41 cases of Legionella. To date in 2015, we have observed 45 cases of Legionella. Legionella bacteria are commonly found in the environment, usually in water. The bacteria grow best in warm water like the water found in hot tubs, cooling towers, hot water tanks, pools, decorative fountains and large plumbing systems. Legionnaires Disease is a respiratory condition caused by when individuals breathe in a mist or vapor (small droplets of water in the air) containing the bacteria. One example might be from breathing in droplets sprayed from a hot tub or pool that has not been properly cleaned and disinfected. The bacteria are not spread from one person to another person. The bacteria do not cause illness by drinking the infected water. Individuals who are most at risk of developing Legionnaires Disease are those who have other underlying or chronic health conditions.

Legionnaires Disease is often observed seasonally, with more cases observed between May and October when the weather is warmer. Symptoms of Legionnaires Disease include cough, shortness of breath, high fever, muscle aches, headaches and gastrointestinal issues. These symptoms usually occur 2 to 14 days after being exposed to the bacteria. Legionnaires Disease is diagnosed through primary care evaluation and laboratory testing and is treated with antibiotics. Like other respiratory illnesses, individuals with other health issues are at greater risk of complications.

The Genesee County Health Department has been working closely with the infection control staff members of our local medical centers. They have communicated Legionella information with their staff members. GCHD has had concerns regarding hospital environments and has worked to ensure that appropriate actions have been taken to address those concerns. Clinical guidance was shared with local physicians. An extensive questionnaire has been used by GCHD staff to identify potential common sources of exposure in those who were ill. GCHD posted a Legionnaires Disease fact sheet to our website during the warm weather months to educate the community about this respiratory condition. GCHD has also collaborated with our colleagues at Michigan Department of Health and Human Service (MDHHS) Epidemiology section regarding this observed increase in cases. These Legionnaires Disease cases are being observed throughout Genesee County. There is no specific geographic pattern identified among the cases. There has not been a single source of exposure identified in common among the cases. The majority of individuals diagnosed with Legionnaires Disease have had other chronic or underlying health conditions and are those most at risk for complications of Legionnaires Disease.

We are now seeing the expected seasonal decline in Legionnaires Disease cases. We remain vigilant with our surveillance efforts and are reaching out to the Environmental Protection Agency for their expertise in reviewing our data. A formal report has been submitted to the Centers for Disease Control through our MDHHS colleagues. GCHD continues to seek out Legionella expertise to address this observed increase in disease. The Genesee County Health Department continues to work to prevent the presence of Legionnaires Disease in our community.

**DATE:** January 14, 2016 **END DATE:** January 30, 2016  
**CONTACT:** Suzanne Cupal, MPH  
**PHONE:** (810) 768-7970  
**RE:** Legionnaires Disease Increase in Genesee County

The Genesee County Health Department (GCHD) would like to provide additional information regarding the announcement of an increase in the number of legionellosis cases in Genesee County. Legionellosis is a respiratory infection characterized by the bacteria *Legionella* and can present as either Legionnaire's disease or as a milder illness called Pontiac fever. Legionnaire's symptoms include fever, cough, shortness of breath, muscle aches, clinical pneumonia, and sometimes diarrhea and abdominal pain. Pontiac fever has similar symptoms but does not progress to pneumonia. Antibiotics are highly effective against *Legionella* bacteria.

*Legionella* bacteria are commonly found in the environment (rivers, lakes, streams). It is a waterborne disease, usually located in man-made water supplies that aerosolize water, such as showers, hot water tanks, humidifiers, cooling towers, whirlpool spas, and decorative fountains. People get Legionnaire's disease when they breathe in a mist or vapor containing the bacteria. Aspiration is the most common way that bacteria enters the lungs. The bacteria are not spread from one person to another person. One cannot become ill from drinking water containing *Legionella*. Water does not need to be filtered to remove *legionella*. People who are at most risk of developing legionellosis are those who are older, smokers/former smokers, immunosuppressed, or who have other underlying or chronic health conditions.

Proper maintenance and disinfection of hot water tanks, humidifiers, cooling towers, whirlpool spas, and decorative fountains are the most effective measures in preventing outbreaks. Maintaining hot water systems at 50°C or higher may reduce the risk of transmission.

## Information needed on Legionella Cases in Genesee County for 10/22/2015

Summary of 2015 data – Shannon preparing, working on updating Meghan's Sept summary

### Questions for GCHD

1. What information have you requested from McLaren?
  - a. Have you received it?

2- Has GCHD distributed last yr's summary as promised?

### Questions for McLaren

1. For cases with a McLaren exposure during incubation period, where were they hospitalized during incubation period prior to LD? Last year vs this year – any change? [In same tower on different floors is all GCHD has told us]. Specific information on this would help identify problem areas for hospital re treatment. Assume they are working on this with consultants?
2. Is McLaren going to share environmental testing results that they have done over the past year? Are the samples being retained (to match potential clinical samples)?
3. Over the past year, since this began with McLaren, what were the hyperchlorination dates?
  - Need to know to see if any impact on number of cases after these dates
4. When did McLaren switch to monochloramine? Is this a one-time treatment?
  - a. Monitor cases post-monochloramine treatment
5. Testing for Legionella: are test numbers available for 2013, 2014, 2015? – to show increase in testing performed, as this will impact what you're finding. When did McLaren change policy about testing all admissions with pneumonia?

**Bohm, Susan (DHHS)**

---

**From:** Johnson, Shannon (DHHS)  
**Sent:** Friday, October 16, 2015 3:33 PM  
**To:** Collins, Jim (DHHS)  
**Cc:** Bohm, Susan (DHHS); Weinberg, Meghan (DHHS)  
**Subject:** Legionnaire's numbers

**From 5/1/14-4/30/15:**

17/45 cases were hospitalized at McLaren during their exposure period 37.87%

23/45 had inpatient or outpatient exposure at McLaren during their exposure period 51.11%

13/45 cases' residences were not on city of Flint water and had no know healthcare exposures to McLaren (possible sporadic cases)

**From 5/1/15-present:**

19/42 cases were hospitalized at McLaren during their exposure period. Current data available doesn't yet have complete information for outpatient visits

14/42 cases' residences were not on city of Flint water and had no know healthcare exposures to McLaren (possible sporadic cases)

---

48.37%

So since the increase started in May 2014, at least 42/87 cases had some type of exposure to McLaren during their incubation period.

It's the cutting with restriction enzymes and the time run that differs between types of samples, so while it is a different gel than other isolates we run we do have the capability to add in samples as we go. There is some extra time involved on the front end, but we are happy to do what we can to ensure that Epi has all the info it needs for the investigation portion. Just let us know when you would like us to stop running new isolates.

Hi Shannon,

We have another one from the Genesys Medical Center that we had come up as positive yesterday afternoon if you would like that one added as well we can do so. The number for that one is **PHI** and was collected on the 3rd.

The reference team is going to go ahead and keep the culture of it growing so it can go in with the rest for PFGE if you would like.

## Genesee Legionellosis Conference Call

6/26/15

Updates/information on the new June cases:

Any new information from McLaren:

Any recent environmental test results?:

Any updates from Genesee water department? :

Aware of any changes to water processing in the city system?:

Discussion on any modifications to data collection tools :

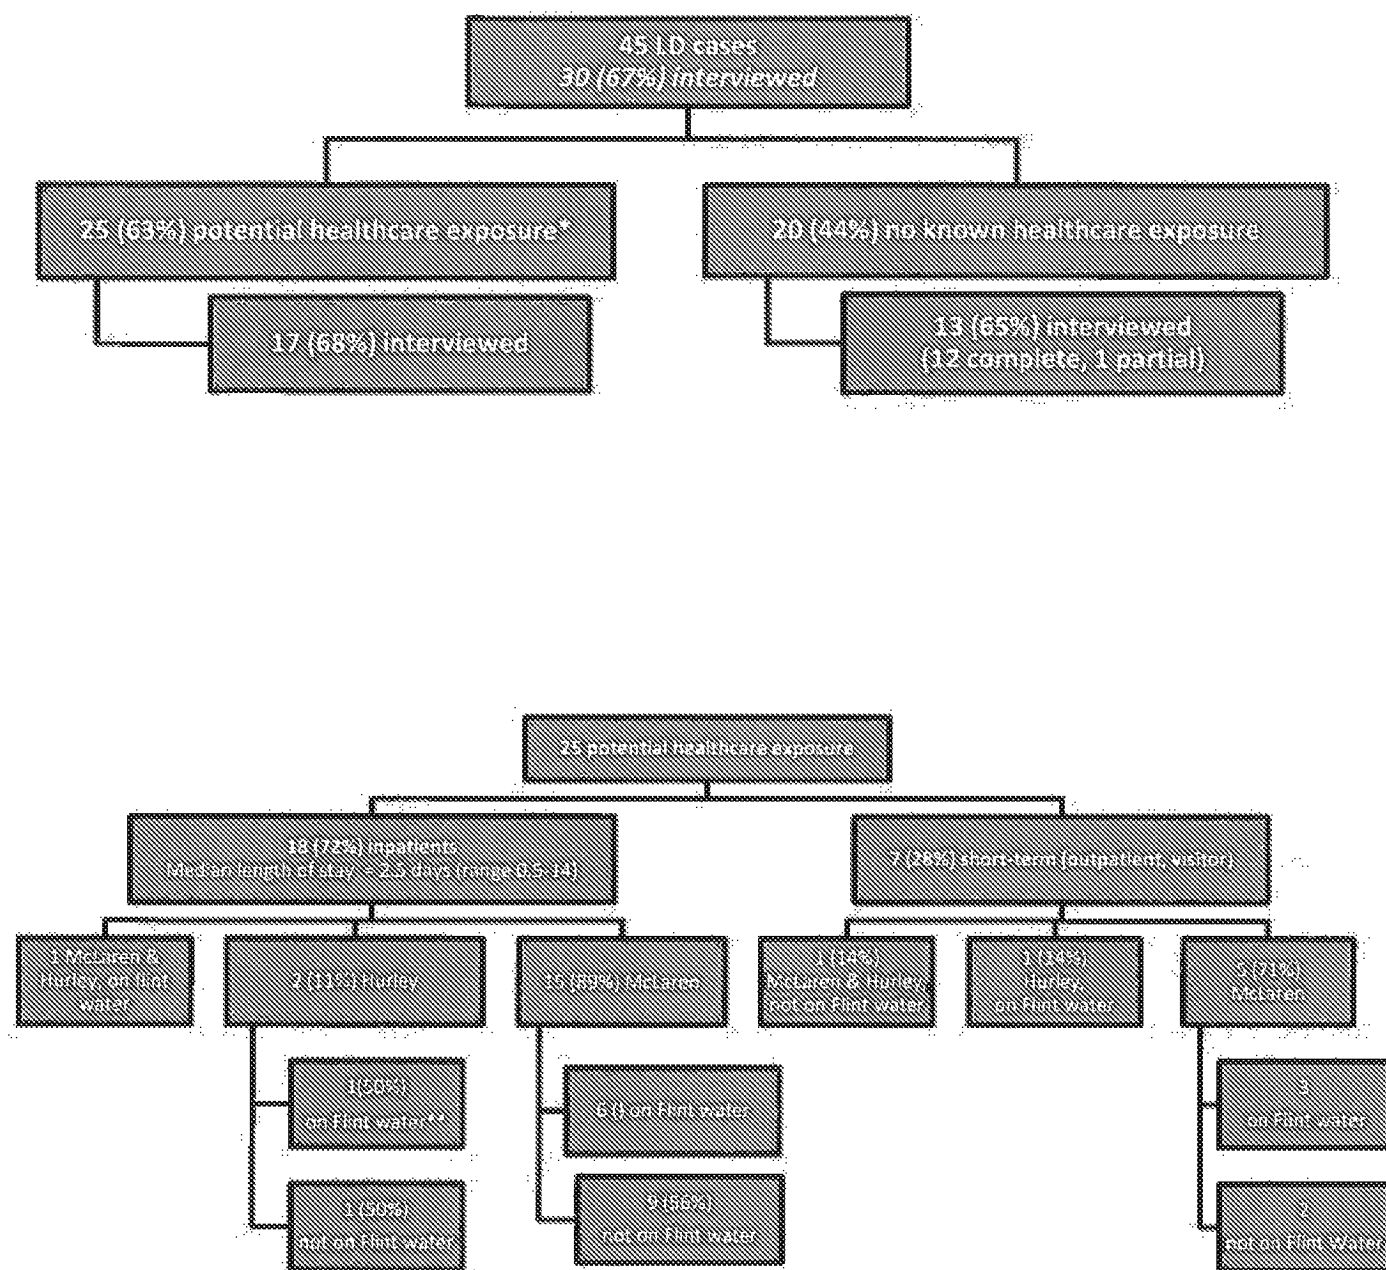

Lab results on 2 sputum specimens- pending at Bot.

Genesee POC?:

Future investigation plans:

## Legionellosis Cases by Healthcare Exposure (as of May 15, 2015)

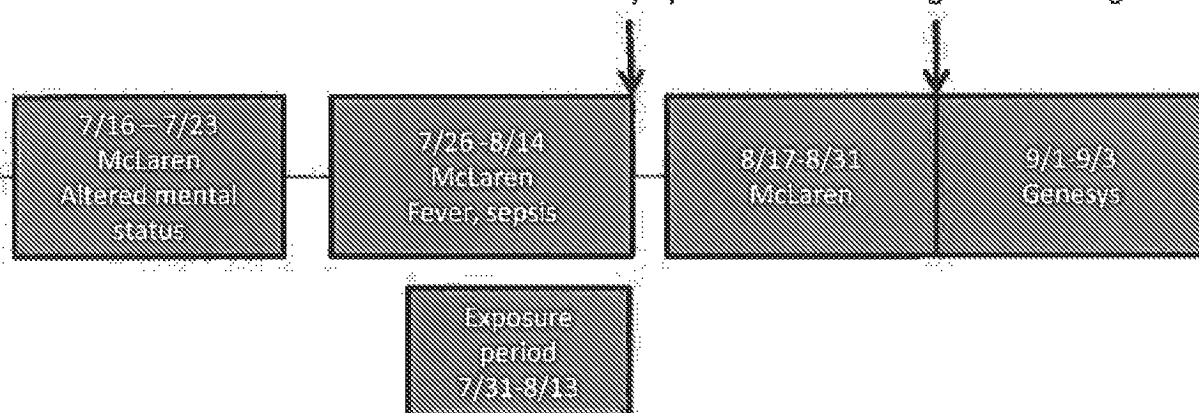

\* Healthcare exposure = Inpatient, outpatient or visitor to McLaren or Hurley health systems during 14 days prior to symptom onset date (exposure period)

\*\* On Flint water = patient's residential water (during exposure period) supplied by City of Flint

## Type of Healthcare Exposure

## Bohm, Susan (DHHS)

---

**From:** Johnson, Shannon (DCH)  
**Sent:** Wednesday, February 04, 2015 2:39 PM  
**To:** Hasan, Shurooq; Henry, James  
**Cc:** Cupal, Suzanne; Childs, Bonnie; Johnson, M.D., Gary; Valacak, Mark; Fiedler, Jay (DCH); Bohm, Susan (DCH); Collins, Jim (DCH); Miller, Corinne (DCH)  
**Subject:** RE: Genesee Legionellosis Investigation  
**Attachments:** MDCH Response 2-4-15.docx

Dear GCHD,

Thank you all for your response. I have attached the Word document with additional MDCH answers to your questions (in blue). Moving forward, we've identified some next steps in our collaboration on the investigation. I spoke with Shurooq today and we made decisions on the division of labor for these points.

- 1) Genesee will send MDCH a copy of their current line list by this Friday, Feb 6<sup>th</sup>. We will use this as the master line list for the investigation.
- 2) Please provide an estimated date of when the HAN discussing clinical testing will be sent to providers in the community. We would appreciate seeing a copy of the final HAN prior to it being sent out. I discussed some points of clarification about the HAN language with Shurooq on the phone today. The hospitals will be following their own protocols for respiratory culture testing to attempt to isolate legionella. Genesee may want to include language in the HAN suggesting bronchial washes be used as they are more likely to contain sufficient bacteria for culture growth compared to a sputum specimen. If the legionella bacteria is identified at the hospital lab, those isolates will be sent along to the MDCH lab for additional testing.
- 3) We would like to have an outbreak-specific questionnaire finalized by the end of next week, Friday Feb 13th. Per Shurooq, Genesee is collaborating with Joan Rose from MSU on water system-specific questions. MDCH will begin creating a questionnaire template to be combined with Genesee's questions and a final version will be reviewed by both agencies.
- 4) MDCH has requested medical record access for the legionellosis investigation from Genesys, Hurley, and McLaren hospitals. After discussing with Shurooq, MDCH will begin to collect information on previous hospitalizations (dates, admission complaint, etc.) for cases.
- 5) Onset dates (or estimated onset dates) for all cases need to be determined. Genesee will work to collect this information on new cases (since 1/1/15). MDCH will review medical records in MDSS and contact hospitals as needed to determine onset dates for previous cases (6/1/14-12/31/14).
- 6) Considerations for defining the investigation. In this situation, the term outbreak is being used in the epidemiologic sense, meaning an increase in cases of above baseline. Based on this, the current Genesee outbreak began in June, 2014 with 5 reported cases. Until further information is collected and analyzed the definition will be general: Cases of legionellosis (Legionnaires' Disease and Pontiac fever) in Genesee County since 6/1/14. In the future, we may be able to refine the definition as additional data is obtained. If Genesee prefers, they may mark all cases in MDSS meeting the current definition as outbreak-associated and assign an outbreak ID. This is generally more useful when needing to search the MDSS for a subset of cases in the system. Since the outbreak currently includes all Genesee legionellosis cases since 6/1/14, it is not as urgent.

If there are other initial steps you would like to include please feel free to add them to the list.

Best wishes,  
Shannon

**Subject:** RE: Genesee Legionellosis Investigation

Dear MDCH Colleagues,

We appreciated the opportunity to discuss the increase in legionellosis cases that Genesee County is experiencing. Collaboration is one of our core values as a local health department. MDCH has been a valued partner who brought resources and expertise to assist in solving some very challenging situations in the past. We look forward to the positive elements you can bring to this investigation.

As discussed during our call, we have concerns not only about legionellosis, but are involved in multiple investigations concerning the safety of local water. We were appreciative of the opportunity to share our investigation to date and our plans for continued investigative work. We are also appreciative of the opportunity to request MDCH's assistance in moving our investigation forward. We look forward to continued and improved communication and collaboration and appreciate your offers of assistance.

We appreciate your acknowledgment of the sensitive nature of our work in an environment of anxiety and suspicion. We do not want to jump to conclusions based upon very limited and inconclusive evidence and your assistance in filling some of the information gaps we have identified would be of great help. We specifically asked for your assistance in identifying someone at MDCH with expertise in type 1 water supplies and communicable disease. That was not reflected in your response. Please let us know if there is an identified resource for this at MDCH. In addition, we requested your support in identifying someone on your staff who could function as a liaison with your fellow state colleagues at MDEQ since a number of questions have come up regarding the type 1 water supply where the state has regulatory authority and access to important data.

As we indicated in our call, we continue to identify and reach out to those that can inform our investigation and provide more information regarding water and legionellosis. The feedback that we are receiving has been very helpful in evolving our investigation. However, additional expertise is being sought as the investigation unfolds.

We have met internally and collaborated on our responses to your questions. In your response, you make reference to the scope of the outbreak. We encourage you to review the case notes in MDSS. If we are referring to this as an outbreak, we would like to request that we designate it as such and include an outbreak identifier in MDSS. We would also like to discuss criteria for inclusion for this outbreak. During our call, we informed you of our work in identifying close contacts of our cases that subsequently became cases themselves or tested positive but did not meet the case definition to be reported as a confirmed case. We also described the challenges in recording onset dates (see the notes). You have requested line listings on a regular basis. We would like to propose regular meetings via conference

call to discuss details of how we record information in MDSS as well as to share our mutual findings. Based on our experiences regarding this investigation, we would also like to make recommendations regarding the reporting process.

We look forward to our collaborative process. We want to remind you that in addition to our legionellosis investigation, we are also investigating water related issues. As we continue to learn more through this process, we hope to be in a position to share our findings with others.

Your GCHD Colleagues

**Subject:** RE: Genesee Legionellosis Investigation  
**Importance:** High

Good Afternoon All,

While you all at the Genesee County Health Department are reviewing Shannon's post from a couple of days ago (Copied below. We look forward to hearing your thoughts on this as well), I thought I'd go ahead and provide some additional information that we've compiled after the conference call.

During our conversation, there was a request for information about the public health outreach to the clinical community in response to an increase in legionella infections being reported from the metropolitan Detroit area and several other states (spring/summer 2013). Specifically, we discussed the text of a health alert message that was shared with the region's hospitals via the Michigan Health Alert Network (MIHAN) and any accompanying documentation.

I've got both to offer to you today.

I've attached the document, "Legionellosis Guidance for Clinicians" that was distributed with the following MIHAN message:

**Text from SE Legionellosis increase HAN in 2013:**

**"Subject: Legionellosis in S.E. Michigan**

*Detroit City, Wayne and Macomb Counties have reported 35 cases of Legionellosis in June. This represents the highest number of Legionellosis cases for the month of June over the past decade and new cases continue to be identified in these jurisdictions. Most patients were or are still hospitalized (some in the ICU) and symptoms reported include fever, vomiting, abdominal pain, nausea and diarrhea. The CDC has also provided notification indicating an increase in Legionellosis cases in the Northeast (NY, DE, CT & PA).*

*Investigations are ongoing in Southeast Michigan to determine common sources of exposure. We are asking that the clinical community assist in this investigation through accurate identification, testing and reporting of all suspect cases of Legionellosis.*

Attached, please find guidance that has been prepared to assist clinicians in case evaluation and facilitate specimen collection/testing as well as an updated "Supplemental Interview Form" for local health department use in evaluating reported cases."

Please note that in the attachment, there is introductory room to offer a local assessment of the situation and the rationale behind distributing the MIHAN message. We feel that GCHD is best positioned distribute a message to the healthcare community and to provide local context to that message but are certainly available to provide assistance to either function if you'd prefer.

Again, we do look forward to hearing your thoughts on Shannon's previous post and stand ready to assist in whatever capacity might best serve the investigation.

All My Best,  
Jim

**Subject:** Genesee Legionellosis Investigation

Greetings GCHD,

Thank you for the opportunity to speak with you this morning. After being updated on where GCHD is in the investigation process, we have identified some items that need additional details and/or may require additional data gathering efforts. In addition, we've listed areas where we can provide personnel to assist with data collection/analysis

or aid in communication between the involved governmental departments during the outbreak investigation. At this point, the priorities in the public health investigation are to determine the scope of the outbreak and to define as clearly as possible the characteristics of the cases of Legionnaire's Disease and Pontiac Fever. These data will be critical to help inform and provide direction for the environmental side of the investigation.

Data being requested by MDCH and/or suggested data collection needs to be addressed:

- 1) Please provide the name of the primary point-of-contact for the overall GCHD legionellosis investigation.
- 2) The current copy of the GCHD Legionnaires Disease outbreak data collection line list is requested and updates sent to MDCH on a regular basis.
- 3) Onset dates or estimated onset dates need to be determined for all cases.
- 4) A current map of the municipal water system needs to be obtained and cases' residences mapped in relation to the water system.
- 5) The investigation needs a Genesee-specific supplemental questionnaire beyond the MDCH supplemental form and the 6 questions in the email message dated 10/17/14.
- 6) All previous cases (since 5/1/14) and new cases should be re-interviewed as soon as possible with the new outbreak-specific questionnaire. If cases are not available, then a proxy should be interviewed, ideally someone from the same household.
- 7) To look for cases of milder illness such as Pontiac Fever, the questionnaire should ask if there are other household members who have had a similar respiratory illness. Any household contacts with legionellosis-consistent illness should also be interviewed with the outbreak-specific questionnaire.
- 8) Clinical culture specimens, in addition to urine antigen testing, should be collected from all suspect cases where individuals are seeking medical care.
- 9) Hospitals should be queried to determine whether any previously diagnosed cases had respiratory cultures collected and whether any of these culture specimens were retained. If so, it should be requested that these samples be held until a determination on environmental testing can be made.

Assistance that MDCH can provide to Genesee to aid in the outbreak investigation:

- 1) MDCH can provide language to GCHD for distribution to the medical community regarding the request for clinical respiratory culture collection on all suspect cases of legionellosis (Legionnaire's Disease and Pontiac Fever).
- 2) MDCH staff is available to conduct medical record extraction, as needed.
- 3) MDCH staff can assist with data entry into MDSS, as needed.
- 4) MDCH staff can help with the development of a Genesee-specific outbreak questionnaire.
- 5) MDCH is willing to assist with supplemental questionnaire data collection by conducting case interviews (on previously and/or newly diagnosed cases) and also by assisting with data analysis, as needed.
- 6) MDCH can assist with the coordination and communication with MDEQ for specific data requests by GCHD.
- 7) The MDCH PIO can work with the GCHD PIO to develop a coordinated public health message to respond to public and media inquiries.

If there are other issues that we have not addressed where our assistance would be helpful, please do not hesitate to ask. We appreciate your efforts and recognize the delicate situation you are dealing during this investigation. We look forward to continued communication and collaboration with you.

Regards,  
Shannon Johnson

Shannon Andrews Johnson, MPH  
Infectious Disease Epidemiologist

Michigan Dept. of Community Health  
201 Townsend St., CVB 5th Floor  
Lansing, MI 48913  
Phone: 517-335-8165  
Fax: 517-335-8263

Data being requested by MDCH and/or suggested data collection needs to be addressed:

1) Please provide the name of the primary point-of-contact for the overall GCHD legionellosis investigation. Shurooq Hasan is lead on the CD investigation. Jim Henry is the lead on the water system investigation. Our entire CDIRT team is involved in both investigations. Shannon Johnson will serve as the primary point-of-contact for MDCH. Shannon will coordinate directly with Shurooq and Jim at GCHD.

2) The current copy of the GCHD Legionnaires Disease outbreak data collection line list is requested and updates sent to MDCH on a regular basis. Let us know the time table you are proposing. We would like to request a regular meeting schedule so we can discuss our mutual findings.

The Genesee line list will serve as the master line list for the outbreak investigation. The Genesee line list should be provided to MDCH weekly and any data gathered by MDCH will be added.

3) Onset dates or estimated onset dates need to be determined for all cases. As discussed during our call, we can provide estimated onset dates. We would like your input...would you prefer we report the onset date reported by the patient, their primary care physician or the ID Physician consulting? There are differences. Please keep this in mind when reviewing the data.

For new cases, the onset date from the patient interview should be used. For older cases, the medical record should be used to assist in determining the estimated onset date. The Influenza Hospitalization Surveillance Project uses the following recommendations for determining estimated onset dates from medical records:

- "In some cases you will need to calculate the date of onset based on notes in the Admission H&P or Discharge Summary that indicate that fever or cough began days earlier.
  - Couple of days = 2 days
  - Few days = 3 days
  - Several days = 5 days
  - Week = 7 days
  - For example if a patient is admitted 10/15 (Day 0) and the Admission H&P indicates the patient complained of fever/cough for "a few" days, then the earliest date of onset of respiratory symptoms is 10/12:

Date:	10/12	10/13	10/14	10/15
Day Number:	-3	-2	-1	0
	Onset	←		Admission

- If date of onset is provided as a range of dates, use the earliest date as date of onset of respiratory symptoms.
  - For example, if a date of onset is given as "3 to five days ago", list the date corresponding to 5 days ago."

Date:	10/10	10/11	10/12	10/13	10/14	10/15
Day Number:	-5	-4	-3	-2	-1	0
	Onset	←				Admission

- 4) **A current map of the municipal water system needs to be obtained and cases' residences mapped in relation to the water system.** As discussed in our call, we are experiencing difficulty in obtaining the information we have requested from DWP and MDEQ. We have sent the FOIA request for the current map of the municipal water system. As discussed during our call, we have mapped our cases to look for commonalities and to identify the proximity of the cases to the boil water advisories. MDCH will communicate with MDEQ about obtaining the water system map. If you have the information, please provide to MDCH a copy of the boil water advisories (or dates) and the areas they cover.
- 5) **The investigation needs a Genesee-specific supplemental questionnaire beyond the MDCH supplemental form and the 6 questions in the email message dated 10/17/14.** As discussed in our call, GCHD has been identifying and reaching out to individuals with expertise with type 1 water supplies. During our call, we asked specifically of anyone at MDCH has this expertise. Please let us know if you have a staff member we can consult with. Also stated during our call, we requested the assistance of MDCH in creating our Genesee specific questionnaire....the questionnaire we are currently using. We are reaching out to water experts to assist in the updating of our questionnaire. In the limited conversations we have had so far, we have learned a great deal which will inform the questions we need to ask. We also look forward to additional conversations with our MDCH colleagues. MDCH does not have staff with expertise in type 1 water supplies, this falls under the purview of MDEQ and the local water authority. MDCH is able to advise specifically on legionella related to human illness. The compiled data provided by the cases on the questionnaire will be vital to directing the focus and scope of potential future environmental testing. A general supplemental data form developed by MDCH was provided to Genesee on 10/17/14. MDCH will work with GCHD to develop a Genesee-specific questionnaire for the outbreak.
- 6) **All previous cases (since 5/1/14) and new cases should be re-interviewed as soon as possible with the new outbreak-specific questionnaire.** If cases are not available, then a proxy should be interviewed, ideally someone from the same household. See me notes below...
- 7) **To look for cases of milder illness such as Pontiac Fever, the questionnaire should ask if there are other household members who have had a similar respiratory illness.** Any household contacts with legionellosis-consistent illness should also be interviewed with the outbreak-specific questionnaire. As discussed on the call in the review of our investigations, we have found this and, we have been reporting this... and have reported them in MDSS. This is the

reason why we asked for testing of clinical samples not only of the patients, but, also of their close contacts.

- 8) **Clinical culture specimens, in addition to urine antigen testing, should be collected from all suspect cases where individuals are seeking medical care.** As discussed in our call, this is what we have requested from MDCH. In addition, we requested testing of close contacts, environmental testing of the patient home environments and potentially testing of key locations in the community with high heterotrophic plate counts. Based on the feedback from our consultations, this may be very helpful. As detailed in the HAN language provided by MDCH to GCHD, hospitals should collect culture specimens in addition to the urine antigen test. If an isolate of Legionella is found from the culture, the hospital will send the isolate to the MDCH Bureau of Laboratories for further testing.

- 9) **Hospitals should be queried to determine whether any previously diagnosed cases had respiratory cultures collected and whether any of these culture specimens were retained. If so, it should be requested that these samples be held until a determination on environmental testing can be made.** This was discussed at our Bug Fuzz meeting on 1/22/15. We will also be requesting more information regarding previous years legionella testing. We suspect a significant increase in the numbers of tests conducted, particularly during August/September than in previous years. Remember, the hyperchlorination done at our hospital of interest was completed 10/4/15. That may also influence the number of tests conducted.

**Assistance that MDCH can provide to Genesee to aid in the outbreak investigation:**

- 1) **MDCH can provide language to GCHD for distribution to the medical community regarding the request for clinical respiratory culture collection on all suspect cases of legionellosis (Legionnaire's Disease and Pontiac Fever).** What we specifically requested was the specific testing protocols for sample collection, storage and transportation of clinical samples. We also requested testing of environmental samples from patient homes and key community sites. We would like the same protocol information for this type of testing as well. Jim's email covered some of this, but, we still have some questions. Hospitals should be familiar with testing protocols for legionella culture specimens. If a legionella isolate is found by the hospital, the handling and shipment to BoL for additional testing is discussed in the language of the HAN.
- 2) **MDCH staff is available to conduct medical record extraction, as needed.** Medical records are attached in MDSS and we do not need assistance with this at this time.
- 3) **MDCH staff can assist with data entry into MDSS, as needed.** At this time, we do not need assistance with this. Please see the note below.
- 4) **MDCH staff can help with the development of a Genesee-specific outbreak questionnaire.** We welcome your participation in the revision of our Genesee specific questionnaire. We have already received some helpful feedback from our expert consultations. We would like to have an outbreak-specific questionnaire finalized by the end of next week, Friday Feb 13th. Per Shurooq, Genesee is collaborating with Joan Rose from MSU on water

12

13

14

15

system-specific questions. MDCH will begin creating a questionnaire template to be combined with Genesee's questions and a final version will be reviewed by both agencies.

5) MDCH is willing to assist with supplemental questionnaire data collection by conducting case interviews (on previously and/or newly diagnosed cases) and also by assisting with data analysis, as needed. Our CD nurses can address newly diagnosed cases. We would like to discuss MDCH's assistance for conducting interviews with previously diagnosed/interviewed cases. MDCH staff members are available to assist with interviewing older cases. We can discuss this issue further after the questionnaire is completed.

6) MDCH can assist with the coordination and communication with MDEQ for specific data requests by GCHD. As discussed in our call, we are requesting MDCH assistance with obtaining information from MDEQ. GCHD has sent a FOIA letter requesting the information we have not been able to obtain regarding the water system. If we do not receive the information or have other challenges we would request MDCH assistance in obtaining the information. MDCH will communicate with MDEQ about obtaining the water system map.

7) The MDCH PIO can work with the GCHD PIO to develop a coordinated public health message to respond to public and media inquiries. As discussed in our call, the water system is an extremely sensitive topic. We are very careful in crafting messages. Should we need MDCH PIO assistance, we will request it.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions.

## Legionellosis Guidance for Clinicians

### Intro discussing increase in Genesee cases.

Legionella bacteria can be found in natural, freshwater environments, but they are generally present in insufficient numbers to cause disease. Water systems such as potable (drinking) water systems, whirlpool spas, and cooling towers provide the conditions needed for Legionella growth and transmission-heat, stasis, and aerosolization; therefore, these are common sources of outbreaks.

### **Epidemiologic Risk Factors for Legionellosis**

- Recent travel with an overnight stay outside of the home (up to 14 days prior to symptom onset)
- Exposure to whirlpool spas
- Recent repairs or maintenance work on domestic plumbing
- Renal or hepatic failure
- Diabetes
- Systemic malignancy
- Smoking
- Immune system disorders
- Age > 50 years

### **Diagnosing Legionellosis**

	<b>Legionnaires' disease</b>	<b>Pontiac fever</b>
<b>Clinical features</b>	Pneumonia, cough, fever	Flu-like illness (fever, chills, malaise) without pneumonia
<b>Radiographic pneumonia</b>	Yes	No
<b>Incubation period</b>	2-14 days after exposure	24-72 hours after exposure
<b>Etiologic agent</b>	<i>Legionella</i> species	<i>Legionella</i> species
<b>Attack rate</b>	< 5%	> 90%
<b>Isolation of organism</b>	Possible	Never
<b>Outcome</b>	Hospitalization common Case-fatality rate: 5-30%	Hospitalization uncommon Case-fatality rate: 0%

Source: <http://www.cdc.gov/legionella/clinicians.html>

### **Who to Test for Legionnaires' Disease**

- Patients with pneumonia in the setting of a Legionellosis outbreak
- Patients who have failed outpatient antibiotic therapy
- Patients with severe pneumonia, in particular those requiring intensive care
- Immunocompromised host with pneumonia
- Patients with a travel history [Patients that have traveled away from their home within two weeks before the onset of illness.]
- Patients suspected of healthcare-associated pneumonia

### Testing for Legionnaires' Disease

- Urinary antigen assay AND culture of respiratory secretions on selective media are the preferred diagnostic tests for Legionnaires' disease
- Sensitivity varies depending on the quality and timing of specimen collection as well as technical skill of the laboratory performing the test

### Advantages and Disadvantages of Diagnostic Tests

Test	Advantages	Disadvantages
Culture	<ul style="list-style-type: none"><li>• Clinical &amp; environmental isolates can be compared</li><li>• Detects all species &amp; serogroups</li><li>• 100% specific</li></ul>	<ul style="list-style-type: none"><li>• Technically difficult</li><li>• Slow (&gt;5 days to grow)</li><li>• Sensitivity highly dependent on technical skill</li><li>• May be affected by antibiotic treatment</li></ul>
Urine Antigen	<ul style="list-style-type: none"><li>• 100% specific...</li><li>• Rapid (same day)</li></ul>	<ul style="list-style-type: none"><li>• ...but only for <i>L. pneumophila</i> serogroup 1 (Lp1) [ which may account for up to 80% of cases]</li><li>• Does not allow for molecular comparison to environmental isolates</li></ul>
Serology	<ul style="list-style-type: none"><li>• Less affected by antibiotic treatment</li><li>• 80-90% sensitive; 99% specific</li></ul>	<ul style="list-style-type: none"><li>• Must have paired sera</li><li>• 5-10% of population has titer 1:≥256. Single acute phase antibody titers of 1: ≥256 do not discriminate between cases of Legionnaires' disease and other causes of community-acquired pneumonia.</li></ul>
DFA	<ul style="list-style-type: none"><li>• Can be performed on pathologic specimens</li><li>• &gt;95% specific</li></ul>	<ul style="list-style-type: none"><li>• 25-75% sensitive</li></ul>
PCR	<ul style="list-style-type: none"><li>• Rapid</li></ul>	<ul style="list-style-type: none"><li>• Assays vary by laboratory and are not FDA-approved</li></ul>

### Clinical Isolates and Shipping

Isolation of Legionella from respiratory secretions, lung tissue, pleural fluid, or a normally sterile site is still an important method for diagnosis, despite the convenience and specificity of urinary antigen testing. Investigations of outbreaks of Legionnaires' disease rely on both clinical and environmental isolates. Clinical and environmental isolates can be compared using monoclonal antibody and molecular techniques. Because Legionella are commonly found in the environment, clinical isolates are necessary to interpret the findings of an environmental investigation.

.....

*The Michigan Department of Community Health state laboratory will test clinical isolates shipped to the facility free of charge. Please freeze any clinical samples collected immediately and maintain the cold chain during shipment (use of dry ice during shipping is preferable). Also, please avoid freezing and thawing of isolates. For labs shipping a clinical isolate, a BYCE plate is acceptable. NOTE: Plates do not generally travel well so a courier should be used if possible.*

#### **Treatment**

Recommended treatment for Legionella pneumonia in most patients includes either a fluoroquinolone (e.g. levofloxacin 750 mg once daily) or a macrolide (e.g. azithromycin 1 gram on day one, followed by 500 mg once daily) for a total treatment duration of 10–14 days. Antibiotic regimen and treatment duration may vary depending on specific patient risk factors or comorbidities.

#### **Reporting**

Legionellosis is a reportable disease in Michigan. We are asking health care professionals to report both Legionnaires' disease and Pontiac fever cases via the Michigan Disease Surveillance System (MDSS) or directly to the Local Health Department. Physicians are requested to collect and record illness onset dates as part of the patient record. An accurate illness onset date is extremely important to determine the patient's potential environmental exposures and is vital to the investigation of an outbreak. In patients with chronic respiratory conditions, the first appearance of fever may be a useful indicator of legionellosis onset date.

**MDHHS issues update to 2015 Legionnaires' disease report for Genesee County**

LANSING, Mich. — As part of the ongoing investigation into the increase of Legionnaires' disease (LD) in Genesee County, the Michigan Department of Health and Human Services (MDHHS) today issued an updated summary for 2015. The update includes three additional LD cases (two deaths) identified since the last report.

"To date, 91 cases and 12 deaths have been identified in total for the 2014 and 2015 healthcare-associated outbreaks in Genesee County," said Eden Wells, M.D., Chief Medical Executive with the MDHHS. "All three additional cases had a hospitalization prior to their LD diagnosis. We remain vigilant in identifying any potential case associated with the outbreak."

All of the new cases were identified by MDHHS personnel from hospital testing data that was forwarded to the department in the past week. Of the three additional cases, two had not been appropriately referred to the public health system. The electronic messages generated by the hospital laboratory system were flawed and a healthcare provider failed to report the cases. The third case was reported in a different jurisdiction and there was no epidemiologic information available to link it to the outbreak.

The public health investigation has looked at a number of potential exposures that the ill people may have experienced; these included exposures to hospitals, water, and community venues. Of the 91 total confirmed cases between June 2014 and <sup>50 (55%)</sup> ~~November~~ <sup>October</sup> 2015, 55 percent had a prior hospital exposure at the same Flint hospital. Although 31 people of 91 (34 percent) received city of Flint water to their residence, 18 of 31 (58 percent) also had the hospital exposure. A total of 26 people, or 29 percent, had no known exposure to a Flint hospital in the two weeks prior to illness, nor were their homes on the Flint water system. No other community exposures were identified.

For the May 2015 to October 2015 time period, 46 LD cases and seven deaths have been confirmed in the Genesee County outbreak. Data previously indicated 43 cases and five LD-associated deaths for 2015. The number of cases for June 2014 through March 2015 time period remains unchanged with 45 LD cases confirmed, including five associated fatalities.

Legionella is a type of bacteria commonly found in the environment that grows best in warm water, such as potable water systems (hospitals, large buildings), hot tubs, cooling towers, and decorative fountains. When people are exposed to the bacteria, it can cause legionellosis, a respiratory disease that can infect the lungs and cause pneumonia. The bacteria can also cause a less serious infection called Pontiac fever. Legionella is not transmitted person to person.

MDHHS has partnered with Wayne State University and continues to work with the Genesee County Health

Department (GCHD) and the Centers for Disease Control and Prevention (CDC) on enhanced surveillance which will continue in 2016.

### MDHHS issues update to 2015 Legionnaires' disease report for Genesee County

LANSING, Mich. — As part of the ongoing investigation into the increase of Legionnaires' disease (LD) in Genesee County, the Michigan Department of Health and Human Services (MDHHS) today issued an updated report for 2015. The report identifies additional cases and deaths identified since the last report, and provides further analysis regarding the investigation.

"To date, 91 cases and 12 deaths have been identified in total for the 2014 and 2015 healthcare-associated outbreaks in Genesee County," said Eden Wells, M.D., Chief Medical Executive with the MDHHS. "We remain vigilant in identifying any potential case associated with the outbreak, and will continue to update information as it becomes available."

*The 3 additional cases all had a hospital stay prior to their illness.*

Of the additional cases, two had not been appropriately referred to the public health system. The electronic messages generated by the hospital laboratory system were flawed and the healthcare providers failed to report the cases. The third case was reported in a different jurisdiction and there was no epidemiologic information available to link it to the outbreak. All of the new cases were identified by MDHHS personnel during a review of hospital testing data that was forwarded to the department in the past week.

*The public health nurse (Jen) looked at hospital records to verify exposure to water & community exposures.*

Of the 91 total confirmed cases between June 2014 and November 2015, 31 people, or 34 percent, received city of Flint water to their residence. A total of 26 people, or 29 percent, had no known exposure to a Flint hospital in the two weeks prior to illness, nor were their homes on the Flint water system. Other possible exposures were evaluated and no known community or residential exposures have been identified.

For the May 2015 to October 2015 time period, 46 LD cases and seven deaths have been confirmed in the Genesee County outbreak. Data previously indicated 43 cases and five Legionnaires-associated deaths for 2015. The number of cases for June 2014 through March 2015 time period has remained unchanged with 45 LD cases confirmed, including five associated fatalities.

Legionella is a type of bacteria commonly found in the environment that grows best in warm water, such as hot tubs, cooling towers, potable water systems, and decorative fountains. When people are exposed to the bacteria, it can cause legionellosis, a respiratory disease that can infect the lungs and cause pneumonia. The bacteria can also cause a less serious infection called Pontiac fever. Legionella is not transmitted person to person.

MDHHS has partnered with Wayne State University and continues to work with the Genesee County Health Department (GCHD) and the Centers for Disease Control and Prevention (CDC) on enhanced surveillance which will continue in 2016.

### Legionellosis Guidance for Clinicians

During the past year, Genesee County has reported over 45 cases of legionellosis. This represents the highest number of legionellosis cases for this time frame over the past 5 years. Investigations are ongoing to determine common sources of exposure. We are asking that the clinical community assist in this investigation through accurate identification, testing and reporting of all suspect cases of legionellosis.

Legionella bacteria can be found in natural, freshwater environments, but they are generally present in insufficient numbers to cause disease. Water systems such as potable (drinking) water systems, whirlpool spas, and cooling towers provide the conditions needed for Legionella growth and transmission-heat, stasis, and aerosolization; therefore, these are common sources of outbreaks.

#### **Epidemiologic Risk Factors for Legionellosis**

- Recent travel with an overnight stay outside of the home (up to 14 days prior to symptom onset)
- Exposure to whirlpool spas
- Recent repairs or maintenance work on domestic plumbing
- Renal or hepatic failure
- Diabetes
- Systemic malignancy
- Smoking
- Immune system disorders
- Age > 50 years

#### **Diagnosing Legionellosis**

	Legionnaires' disease	Pontiac fever
Clinical features	Pneumonia, cough, fever	Flu-like illness (fever, chills, malaise) without pneumonia
Radiographic pneumonia	Yes	No
Incubation period	2-14 days after exposure	24-72 hours after exposure
Etiologic agent	<i>Legionella</i> species	<i>Legionella</i> species
Attack rate	< 5%	> 90%
Isolation of organism	Possible	Never
Outcome	Hospitalization common Case-fatality rate: 5- 30%	Hospitalization uncommon Case-fatality rate: 0%

Source: <http://www.cdc.gov/legionella/clinicians.html>

#### **Who to Test for Legionnaires' Disease**

- Patients with pneumonia in the setting of a Legionellosis outbreak
- Patients who have failed outpatient antibiotic therapy
- Patients with severe pneumonia, in particular those requiring intensive care
- Immunocompromised host with pneumonia
- Patients with a travel history [Patients that have traveled away from their home within two weeks before the onset of illness.]
- Patients suspected of healthcare-associated pneumonia

### Testing for Legionnaires' Disease

- Urinary antigen assay AND culture of respiratory secretions on selective media are the requested diagnostic tests for Legionnaires' disease
- If a provider orders a urine antigen test on a patient with suspect Legionellosis, a respiratory culture for legionella should be collected at the same time
  - A bronchoalveolar lavage (BAL) or tracheal aspirate (TA) are the preferred methods for specimen collection
  - If a BAL or TA are not able to be performed, a sputum specimen may be used for culture, but the likelihood of recovering the bacteria may be decreased
- Any clinical specimen remaining from the respiratory culture should be frozen and stored immediately by the hospital laboratory...
- If a Legionella isolate is recovered, a slant or plate should shipped to the state health department laboratory overnight on cold packs
  - A courier is recommended for plates, if possible, as they do not travel well

### Advantages and Disadvantages of Diagnostic Tests

Test	Advantages	Disadvantages
Culture	<ul style="list-style-type: none"> <li>• Clinical &amp; environmental isolates can be compared</li> <li>• Detects all species &amp; serogroups</li> <li>• 100% specific</li> </ul>	<ul style="list-style-type: none"> <li>• Technically difficult</li> <li>• Slow (&gt;5 days to grow)</li> <li>• Sensitivity highly dependent on technical skill</li> <li>• May be affected by antibiotic treatment</li> </ul>
Urine Antigen	<ul style="list-style-type: none"> <li>• 100% specific...</li> <li>• Rapid (same day)</li> </ul>	<ul style="list-style-type: none"> <li>• ...but only for <i>L. pneumophila</i> serogroup 1 (Lp1) [ which may account for up to 80% of cases]</li> <li>• Does not allow for molecular comparison to environmental isolates</li> </ul>
Serology	<ul style="list-style-type: none"> <li>• Less affected by antibiotic treatment</li> <li>• 80-90% sensitive; 99% specific</li> </ul>	<ul style="list-style-type: none"> <li>• Must have paired sera</li> <li>• 5-10% of population has titer 1:≥256. Single acute phase antibody titers of 1: ≥256 do not discriminate between cases of Legionnaires' disease and other causes of community-acquired pneumonia.</li> </ul>
DFA	<ul style="list-style-type: none"> <li>• Can be performed on pathologic specimens</li> <li>• &gt;95% specific</li> </ul>	<ul style="list-style-type: none"> <li>• 25-75% sensitive</li> </ul>
PCR	<ul style="list-style-type: none"> <li>• Rapid</li> </ul>	<ul style="list-style-type: none"> <li>• Assays vary by laboratory and are not FDA-approved</li> </ul>
Sensitivity varies depending on the quality and timing of specimen collection as well as technical skill of the laboratory performing the test		

### Clinical Isolates and Shipping

Isolation of Legionella from respiratory secretions, lung tissue, pleural fluid, or a normally sterile site is still an important method for diagnosis, despite the convenience and specificity of urinary antigen testing.

Investigations of outbreaks of Legionnaires' disease rely on both clinical and environmental isolates. Clinical and environmental isolates can be compared using monoclonal antibody and molecular techniques. Because Legionella are commonly found in the environment, clinical isolates are necessary to interpret the findings of an environmental investigation.

*The Michigan Department of Health and Human Services state laboratory will test clinical isolates of legionella shipped to the facility free of charge. Please avoid freezing and thawing of isolates. For labs shipping a clinical isolate, a BYCE plate is acceptable. NOTE: Plates do not generally travel well so a courier should be used if possible.*

### Treatment

Recommended treatment for Legionella pneumonia in most patients includes either a fluoroquinolone (e.g. levofloxacin 750 mg once daily) or a macrolide (e.g. azithromycin 1 gram on day one, followed by 500 mg once daily) for a total treatment duration of 10–14 days. Antibiotic regimen and treatment duration may vary depending on specific patient risk factors or comorbidities.

### Reporting

Legionellosis is a reportable disease in Michigan. We are asking health care professionals to report both Legionnaires' disease and Pontiac fever cases via the Michigan Disease Surveillance System (MDSS) or directly to the Local Health Department. Physicians are requested to collect and record illness onset dates as part of the patient record. An accurate illness onset date is extremely important to determine the patient's potential environmental exposures and is vital to the investigation of an outbreak. In patients with chronic respiratory conditions, the first appearance of fever may be a useful indicator of legionellosis onset date.

Genesee Legionnaires' Disease Outbreak Investigation  
Interview Data Analysis Plan

1. Cleaning

- ✓ Check address and City of Flint Water (COFW) status
  - i. Check the one non-COFW to COFW water (purple tabs on Water map)
- ✓ Check hospitalization during exposure period?
- ✓ Create variables: Inpatient Y/N, Outpatient Y/N, Visited Y/N and check if the hospital exposure occurred during the exposure period *HC exp Y/N*

2. Add comorbidity and symptom data from MR/MDSS to EpiInfo -

- ✓ Stratify by healthcare, COFW
- ✓ Basic analysis of interview data
- ✓ Stratify Q4-7 by Tap Water Source

3. Community Exposures Analysis

- ✓ Stratify Community exposures by COFW Y/N
- ✓ Stratify Community exposures by hospital visit status Y/N
- ✓ Map Community Exposures of 9 non-hospital/non-CoFW exposure with interviews *Vern*

4. M- Healthcare exposure analysis *Meghan*

- ✓ Stratify by LoS *length of stay*
- ✓ Stratify by CoF water
- ✓ Stratify by smoking status

5. L- Comorbidity analysis *Meghan*

- ✓ General
- ✓ Of hospitalized patients
  - a. Unknown exposures

6. ~~11~~ non-healthcare, non-flint

- 1) ✓ Check resident address
- ✓ Mapping (see 2c)

Based on Medical Records:

45 Cases

→ 25 people had some exposure to a hospital (inpatient, outpatient, or visitor)

1. 18 hospitalized (inpatient) within exposure period (XX did not)
  - a. 16 McLaren: 8 on CoFW, 8 not on CoFW
  - b. 2 Hurley: 1 on CoFW, 1 not on CoFW
2. 5<sup>+</sup> outpatient visits within exposure period (41 did not, 0 unknown)
  - a. 5 McLaren: 3 on COFW, 2 not on COFW
  - b. One also had an inpatient visit to McLaren (NOT on COFW)
3. 4<sup>+</sup> visited someone in the hospital (17 did not, 23 were unknown)
  - a. 1 visited McLaren and Hurley (NOT on COFW)
  - b. 2 McLaren (1 on COFW, also had inpatient at McLaren, 1 not COFW)
  - c. 1 Hurley (on COFW)

→ 20 people with no exposure to hospital based on Medical Records

4. 8 on COFW
5. 12 not on COFW

→ 12 people not on CoFW with no hospital exposure

6. 9 interviewed
7. 3 lost to follow-up

Based on

*from Suzanne Cypul*

06/24/2014- Bug Fuzz Meeting- Hospitals discussed legionella cases that had been previously hospitalized at McLaren. Began monitoring legionella cases that were previously hospitalized (especially at McLaren) -- GCHD did not note a significant increase in Legionella

07/2014- Total cases hospitalized from McLaren- 3

08/20/2014 CDIRT-Discussed increase in Legionella -- Started to talk to McLaren around this time (suspect cooling towers as potential source, planned meeting with engineering department to discuss their investigation) 6 cases hospitalized from McLaren out of 13

9/4/2014- McLaren identifies location of their patients with legionella, found them same towers but different floors. They have hired someone to inspect the air valves on 13<sup>th</sup> floor and will keep us updated. 10 out of 18 total cases from McLaren

9/05/2014-McLaren First Test

9/26/2014- Test results returned to McLaren

10/4/2014- McLaren does hyper chlorination

10/15/2014- CDIRT-Discussed Legionella- 15 Total cases in September McLaren hyper chlorinated, more cases- Jim to talk to DEQ, develop Environmental survey for cases

10/30/2014- Jim meets with McLaren +DPW- we get results for Heterotrophic plate count ( October only) and McLaren results for testing- McLaren will continue to test monthly for legionella, they have a plan in place for remediation if necessary.

## MDHHS Preliminary Stats on Genesee County Legionellosis Investigation, April 29, 2015

Number of lab-confirmed cases of Legionnaires' Disease: 45

Number of Pontiac fever cases: 1 with positive Ag test but asymptomatic

Total number of legionellosis cases: 46

### Working case definitions:

Confirmed Legionnaires' Disease (LD) -- meets the CDC clinical and laboratory case definition for confirmed LD and illness occurred since June 1, 2014 in residents of Genesee County or those who had visited the Flint area in 2 weeks prior to their illness onset date.

Suspected LD -- meets the CDC clinical and laboratory case definition for suspected LD and illness occurred since June 1, 2014 in residents of Genesee County or those who had visited the Flint area in 2 weeks prior to their illness onset date.

Confirmed Pontiac Fever (PF) -- meets the CDC clinical and laboratory case definition for confirmed PF and illness occurred since June 1, 2014 in residents of Genesee County or those who had visited the Flint area in 2 weeks prior to their illness onset date.

### Geographic distribution:

45/46 Genesee Co (27 Flint, 6 Mt. Morris, 4 Burton, 2 Flint Twp, 1 Flushing, 1 Byron, 1 Davison, 1 Linden, 1 Otisville, 1 Vienna Twp)

1/46 Saginaw County (1 Chesaning)

Age range: 26-94 years

Average age (median): 62.2 years (63.5 years)

% Males: 50% (23/46)

Range of illness onset dates (n=45): 6/6/14- 3/9/2015

Number (%) of deaths: 15.2% (7/46)

Number (%) with other underlying comorbidities: TBD

---

Data sources: MDSS, hospital chart reviews

Date outbreak-specific survey completed and approved: 2/23/15

Number of cases interviewed: 29 completed + one partial (63% complete; 95.7% in total attempted/completed)

MDHHS: 19 completed / 31 contacted (MDCH had 2 interviewers – now increased to 4)

Genesee: 10 completed / 15 (1 status unknown)

Number (%) of cases hospitalized: 45/46 (97.8%). Number in ICU: 22/45 (48.8%)

Number of cases interviewed: 29 completed (63%; 95.7% in total attempted/completed)

MDHHS: 19 completed / 31 contacted (MDCH had 2 interviewers – now increased to 4)

Genesee: 10 completed / 15 (1 status unknown)

Number (%) of cases hospitalized: 45/46 (97.8%). Number in ICU: 22/45 (48.8%)

Number (%) of cases hospitalized at McLaren: 18/45 (40%)

Number (%) of cases hospitalized at Hurley: 14/45 (31%)

Number (%) of cases hospitalized at Genesys: 6/45 (13.3%)

Number (%) of cases hospitalized at other hospitals outside Flint: 7/45 (15.6%)

Number (%) of cases who had been hospitalized in 2-weeks prior to onset: 19/45 (37.8%)

Number (%) of cases who had only a short-term visit to a hospital/healthcare facility in 2-weeks prior to onset: 7/45 (15.6%)

Number (%) of cases who had been hospitalized or who had a short-term visit to a hospital/healthcare facility in 2-weeks prior to onset: 26/45 (57.8%)

Number (%) of cases who work outside the home: 8/46 (17.4%) (min of 72% were at home)

Number (%) of cases who are retired: 20 (43.5%)

Number (%) of cases who are unemployed: 7/46 (15.2%)

Number (%) of cases who are disabled: 6/46 (13%)

Number (%) of cases whose occupation status is unknown: 5/46 (10%)

## Residence Water and Healthcare Exposures During the 2 Weeks Prior to Onset

As of 4/29/15

Healthcare exposure in 2 wks prior to onset	Residence on city water	Residence NOT on city water
Hospitalized at McLaren	8	9
Hospitalized at Hurley	1	1
Outpatient at McLaren	3	1
Visited McLaren	0	2
Visited Hurley	1	0
Visited other hospital	0	1 (Saginaw VA)
No known healthcare exposure	8	11
<b>Total</b>	<b>21</b>	<b>25</b>

### Cases admitted (overnight) to a hospital during the 2 weeks prior to onset:

9/21 (43%) cases on City of Flint water with a hospital admission during the 2 weeks prior to onset.

8/21 (38%) admission to McLaren hospital

1/21 (5%) admission to Hurley

10/25 (40%) cases NOT on City of Flint water with a hospital admission during the 2 weeks prior to onset.

9/25 (36%) admission to McLaren hospital

1/25 (4%) admission to Hurley

### Cases with any hospital exposure during the 2 weeks prior to onset:

13/21 (62%) cases on City of Flint water with any hospital exposure during the 2 weeks prior to onset.

11/21 (52%) admission, outpatient, or visit to McLaren

2/21 (10%) admission or visit to Hurley

14/25 (56%) cases NOT on City of Flint water with any hospital exposure during the 2 weeks prior to onset.

12/25 (48%) admission, outpatient, or visit to McLaren

1/25 (4%) admission to Hurley

1/25 (4%) visit Saginaw VA

### Overall:

17/46 (37%) Hospitalized at McLaren (overnight) during the 2 weeks prior to onset.

23/46 (50%) Any exposure to McLaren during the 2 weeks prior to onset.

# MDHHS Preliminary Data on Genesee County Legionellosis Investigation (April 29, 2015)

## Epi Info Analysis of Questionnaire Data

30 cases of 46 have been interviewed so far (65% interviewed). Of these interviews, 29 are complete and 1 interview was refused half way through (97% completed, 63% of all cases).

3.) Where did you get your tap (drinking and other household use) water from \_\_\_/\_\_\_/\_\_\_ to \_\_\_/\_\_\_/\_\_\_?

Water Source	Number	%
City of Flint Water	13	43
City of Flint Township Water	3	10

## Preliminary Stats on Genesee County Legionellosis Investigation,

April 7, 2015

Number of lab-confirmed cases of Legionnaires' Disease: 45

Number of Pontiac fever cases: 1 possible

Total number of legionellosis cases: 46

Geographic distribution:

45/46 Genesee Co (27 Flint, 6 Mt. Morris, 4 Burton, 2 Flint Twp, 1 Flushing, 1 Byron, 1 Davison, 1 Linden, 1 Otisville, 1 Vienna Twp)

1/46 Saginaw County (1 Chesaning)

Age range: 26-94 years

Average age (median): 62.2 years (63.5 years)

% Males: 50% (23/46)

Range of illness onset dates (n=45): 6/6/14-1/10/15 (new case onset 3/9/2015)

Number (%) of deaths: 15.2% (7/46); expect this number will increase as interviews are completed

Number (%) with other underlying comorbidities: TBD

Conference calls with Genesee County: Jan 27; Feb 10, Feb 19, Apr 7, 2015

Conference calls with hospitals: Jan 28, 2015

Date outbreak-specific survey completed and approved: 2/23/15

Number of cases interviewed: 21 completed (45.7%; 82.6% in total attempted/completed; 7 still unassigned)

MDCH: 14 completed / 29 contacted (MDCH had 2 interviewers – now increased to 4)

Genesee: 7 completed / 10 *2 have deceased - no 3<sup>rd</sup> contact*

Number (%) of cases hospitalized: 45/46 (97.8%).      Number in ICU: 22/45 (48.8%)

Number (%) of cases hospitalized at McLaren: 18/45 (40%)

Number (%) of cases hospitalized at Hurley: 14/45 (31%)

Number (%) of cases hospitalized at Genesys: 6/45 (13.3%)

Number (%) of cases hospitalized at other hospitals outside Flint: 7/45 (15.6%)

Number (%) of cases who had been hospitalized in 2-weeks prior to onset: 20/45 (44.4%)

Number (%) of cases who had been hospitalized in 2-weeks prior to onset at McLaren: 16/45 (35.6%)

Number (%) of cases who had been hospitalized in 2-weeks prior to onset at Hurley: 2/45 (4%)

Number (%) of cases who had been hospitalized in 2-weeks prior to onset at Genesys: 0

Number (%) of cases who had been hospitalized in 2-weeks prior to onset at other hospitals: unknown

Number (%) of cases who had a short-term visit to a hospital in 2-weeks prior to onset:

Number (%) of cases who had a short-term visit to McLaren facility in 2-weeks prior to onset: 5/45 (11.1%)

Number (%) of cases who had a short-term visit to Hurley facility in 2-weeks prior to onset: 1/45 (2%)

Number (%) of cases who had a short-term visit to Genesys facility in 2-weeks prior to onset: 0

Number (%) of cases who had been hospitalized or who had a short-term visit to a hospital facility in 2-weeks prior to onset:

Number (%) of cases who had been hospitalized or who had a short-term visit to a McLaren facility in 2-weeks prior to onset: 21/45 (46.7%)

Number (%) of cases who had been hospitalized or who had a short-term visit to a Hurley facility in 2-weeks prior to onset: 3/45 (6.7%)

Number (%) of cases who had been hospitalized or who had a short-term visit to a Genesys facility in 2-weeks prior to onset: 0

Number (%) of cases who work outside the home: 8/46 (17.4%) [min of 72% at home]

## Prelim data on Legionnaires' Disease Cases in Genesee County from June 2014 to March 18, 2015

44 Legionnaires' disease cases total (as of 3/18/2015)

20 cases on City of Flint water system

24 cases NOT on City of Flint water system. (Originally 25 cases, but one of the non-Flint water system cases is very likely sporadic. No reported Flint water exposures and likely had exposure in Clarkston, MI at job site as industrial painter.)

### Cases admitted (overnight) to hospital during the 2 weeks prior to onset:

8/20 (40%) cases on City of Flint water with admission to hospital during the 2 weeks prior to onset.

7/20 (35%) admission to McLaren hospital

1/20 (5%) admission to Hurley

10/24 (42%) cases NOT on City of Flint water with admission to hospital during the 2 weeks prior to onset.

9/24 (38%) admission to McLaren hospital

1/24 (4%) admission to Hurley

### Cases with any exposure to hospital during the 2 weeks prior to onset:

11/20 (55%) cases on City of Flint water with any exposure to hospital during the 2 weeks prior to onset.

10/20 (50%) admission or visit to McLaren (hospital, wound clinic, cancer institute, community medical center)

1/20 (5%) admission or visit to Hurley (admission)

11/24 (46%) cases NOT on City of Flint water with admission to hospital during the 2 weeks prior to onset.

10/24 (42%) admission or visit to McLaren (hospital, cancer institute)

1/24 (4%) admission or visit to Hurley (admission)

### Overall:

16/44 (36%) Hospitalized at McLaren (overnight) during the 2 weeks prior to onset.

20/44 (45%) Any exposure to McLaren during the 2 weeks prior to onset.

### No hospital exposures

22/44 (50%) have no known hospital exposures in the 2 weeks prior to their onsets.

For those with no known hospital exposure in the 2 weeks prior to onset:

9/22 (41%) are on city of Flint water

13/22 (59%) are NOT on city of Flint water.

Bohm, Susan (DCH)

From: Ann Newell <AnnNewell@hurleymc.com>  
Sent: Wednesday, March 04, 2015 12:57 PM  
To: Bohm, Susan (DCH)  
Subject: RE: Update on legionellosis cases in Genesee County

Called to clarify that  
live @ mscit can check

in Hurley MR for  
other patients with  
legionellosis. 3/6/15

Hi Susan,

You are more than welcome to look back to see if our patients did have a prior admissions. When the cases are identified this is something we look at. We have only one possible case that was reported in December with prior admissions. We however cannot look to see if patients identified at other healthcare facilities had prior admission here at HMC.

Thanks,

Ann M. Newell, CIC

Subject: Update on legionellosis cases in Genesee County

Good morning,

First of all, many thanks for your cooperation and input to date into the ongoing Genesee County legionellosis investigation. One of the aspects of the investigation into the increase in legionellosis cases since June 2014 that we at MDCH have been assisting with was to determine the illness onset dates of those cases, which we would now like to share with you – please see the attached epi curve. Many of the illness onset dates are estimates based on information from the medical records. As you may know, many of the cases had previous hospitalizations, out-patient visits, or visited someone else in a hospital prior to their illness. Our next step is to document all hospital exposures in the 2-week period prior to the illness onset date. If the patient was previously hospitalized or had an out-patient visit at the same hospital where they were hospitalized for legionellosis, that information was readily collected; however, we would now like to ask the hospitals for your consent to allow us to check for hospitalizations/visits in the 2-week period prior to onset for all the legionellosis patients from June 2014 to the present at each of McLaren Flint, Hurley, & Genesys. For example, if someone was hospitalized at hospital A for legionellosis, we would like to check the other two hospitals B & C to see if there was a previous hospitalization or visit 2 weeks prior to illness onset of legionellosis.

Please let me know as soon as possible and thank you again for your continued support during this investigation.

Data being requested by MDCH and/or suggested data collection needs to be addressed:

- 1) **Please provide the name of the primary point-of-contact for the overall GCHD legionellosis investigation.** Shurooq Hasan is lead on the CD investigation. Jim Henry is the lead on the water system investigation. Our entire CDIRT team is involved in both investigations.
- 2) **The current copy of the GCHD Legionnaires Disease outbreak data collection line list is requested and updates sent to MDCH on a regular basis.** Let us know the time table you are proposing. We would like to request a regular meeting schedule so we can discuss our mutual findings.
- 3) **Onset dates or estimated onset dates need to be determined for all cases.** As discussed during our call, we can provide estimated onset dates. We would like your input...would you prefer we report the onset date reported by the patient, their primary care physician or the ID Physician consulting? There are differences. Please keep this in mind when reviewing the data.
- 4) **A current map of the municipal water system needs to be obtained and cases' residences mapped in relation to the water system.** As discussed in our call, we are experiencing difficulty in obtaining the information we have requested from DWP and MDEQ. We have sent the FOIA request for the current map of the municipal water system. As discussed during our call, we have mapped our cases to look for commonalities and to identify the proximity of the cases to the boil water advisories.
- 5) **The investigation needs a Genesee-specific supplemental questionnaire beyond the MDCH supplemental form and the 6 questions in the email message dated 10/17/14.** As discussed in our call, GCHD has been identifying and reaching out to individuals with expertise with type 1 water supplies. During our call, we asked specifically if anyone at MDCH has this expertise. Please let us know if you have a staff member we can consult with. Also stated during our call, we requested the assistance of MDCH in creating our Genesee specific questionnaire...the questionnaire we are currently using. We are reaching out to water experts to assist in the updating of our questionnaire. In the limited conversations we have had so far, we have learned a great deal which will inform the questions we need to ask. We also look forward to additional conversations with our MDCH colleagues.
- 6) **All previous cases (since 5/1/14) and new cases should be re-interviewed as soon as possible with the new outbreak-specific questionnaire.** If cases are not available, then a proxy should be interviewed, ideally someone from the same household. See my notes below...
- 7) **To look for cases of milder illness such as Pontiac Fever, the questionnaire should ask if there are other household members who have had a similar respiratory illness. Any household contacts with legionellosis-consistent illness should also be interviewed with the outbreak-specific questionnaire.** As discussed on the call in the review of our investigations, we have found this and, we have been reporting this... and have reported them in MDSS. This is the reason why we asked for testing of clinical samples not only of the patients, but, also of their close contacts.
- 8) **Clinical culture specimens, in addition to urine antigen testing, should be collected from all suspect cases where individuals are seeking medical care.** As discussed in our call, this is what we have requested from MDCH. In addition, we requested testing of close contacts, environmental testing of the patient home environments and potentially testing of key locations in the community with high heterotrophic plate counts. Based on the feedback from our consultations, this may be very helpful.
- 9) **Hospitals should be queried to determine whether any previously diagnosed cases had respiratory cultures collected and whether any of these culture specimens were retained.** If so, it should be requested that these samples be held until a determination on environmental testing can be made. This was discussed at our Bug Fuzz meeting on 1/22/15. We will also be requesting more information regarding previous years legionella testing. We suspect a

2

3

4

5

significant increase in the numbers of tests conducted, particularly during August/September than in previous years. Remember, the hyperchlorination done at our hospital of interest was completed 10/4/15. That may also influence the number of tests conducted.

**Assistance that MDCH can provide to Genesee to aid in the outbreak investigation:**

- 1) **MDCH can provide language to GCHD for distribution to the medical community regarding the request for clinical respiratory culture collection on all suspect cases of legionellosis (Legionnaire's Disease and Pontiac Fever).** What we specifically requested was the specific testing protocols for sample collection, storage and transportation of clinical samples. We also requested testing of environmental samples from patient homes and key community sites. We would like the same protocol information for this type of testing as well. Jim's email covered some of this, but, we still have some questions.
- 2) **MDCH staff is available to conduct medical record extraction, as needed.** Medical records are attached in MDSS and we do not need assistance with this at this time.
- 3) **MDCH staff can assist with data entry into MDSS, as needed.** At this time, we do not need assistance with this. Please see the note below...
- 4) **MDCH staff can help with the development of a Genesee-specific outbreak questionnaire.** We welcome your participation in the revision of our Genesee specific questionnaire. We have already received some helpful feedback from our expert consultations.
- 5) **MDCH is willing to assist with supplemental questionnaire data collection by conducting case interviews (on previously and/or newly diagnosed cases) and also by assisting with data analysis, as needed.** Our CD nurses can address newly diagnosed cases. We would like to discuss MDCH's assistance for conducting interviews with previously diagnosed/interviewed cases.
- 6) **MDCH can assist with the coordination and communication with MDEQ for specific data requests by GCHD.** As discussed in our call, we are requesting MDCH assistance with obtaining information from MDEQ. GCHD has sent a FOIA letter requesting the information we have not been able to obtain regarding the water system. If we do not receive the information or have other challenges we would request MDCH assistance in obtaining the information.
- 7) **The MDCH PIO can work with the GCHD PIO to develop a coordinated public health message to respond to public and media inquiries.** As discussed in our call, the water system is an extremely sensitive topic. We are very careful in crafting messages. Should we need MDCH PIO assistance, we will request it.

February 19, 2015

PPI , Access code  PPI

### Last Report

### Status

#### 1) Public Safety Update – FPD, MSP, (FFD, if needed)

- a) FPD      Status Report – Murder ↑ ; CSC ↓ 20% ; Robbery ↑  
Arson, Assault, Burg, Larc ↓ ; Auto Theft ↑      Update
- b) FFD      \* SAFER Grant – Recommendation is to not apply in 2015, do  
apply in 2016 in light of anticipated FY17 shortfall.      Update
- c) Other update from  
Chief Tolbert and MSP

#### 2) Governor's Office Update – R. Baird, H. Hollins, B. Clement

Issue of Retirement  
Package for Judges ←

- a) District Court  
Consolidation      County Commissioners voted on 12/10/14 to approve "pursuant  
to the terms and conditions set forth in a MOU to be approved  
between City of Flint and Gen. Cty."      Meeting with County Rep. Feb  
18. Waiting for proposed  
MOU from County.
- b) Local Income Tax  
Initiative      Additional source of funds still needed for City. H. Hollins  
working to find a new sponsor. Projected financial challenges  
associated with projection of FY17 budget may emphasize the  
rational.      No Change

#### 3) Finance and Administrative Update

- a) Financial Ordinances      Complete      Update
- b) Management  
Vacancies      MML has been selected to recruit candidates for Treasurer, HR  
Director and Finance Director. Search for Fire Chief to be added -  
effective date 7/1/15      Update

		Last Report	Status
<i>Fiscal Stabilization Bonds</i>	c) Budget	Dr. Scorsone to assist with updating financial projections by Feb. 18. Budget planning session held with Council on 2/16/17. * Projected gap between revenues and status quo expenses is between \$4.5million and \$5.0million.	New
	d) DEP/RAP	Progress under DEP/RAP being revised.	No change
	e) Purchasing	Revised purchasing ordinance being enacted.	New
<b>4) City Council Update</b>			
	a) EM Order	An Order also being developed defining organizational reporting relationships to new City Administrator.	No Change
	b) Council/Mayor Compensation	Revision to Council and Mayor compensation is being developed.	Update
<b>5) Water Issues</b>			
<i>Specific recommendations forthcoming</i>	a) MDEQ Violation Notice	The next TTHM sampling was conducted 2/17/15, testing will be done by the MDEQ. Our most recent internal tests show water to be within federal/state guidelines. Expect to receive a violation notice from MDEQ, due to the running average calculation, in 7-10 days. The notice to customers will go out by mid-March.	Update
	b) Distressed Cities Grants	Announcements made for grant awards to Flint for Leak Detection and Sewage sludge Load Out Facility.	No Change
	c) Drinking Water Revolving Fund	Discussing possible restructuring of loans.	No Change
	d) Water Quality Consultant	Veolia will provide preliminary recommendations at the 2/18/15 Public Works Committee meeting - including process improvements, distributions system actions, communications improvements, and personnel support by way of new policies and procedures, training and new testing models. Priority budget, and timeline to follow within 1-2 weeks; much improvement has occurred as demonstrated by the most recent testing.	Update
<i>40 organizations</i>	e) WAC/TAC	A Water Advisory Committee and a Technical Advisory Committee have been formed as part of the process of improving communication and receiving additional feedback.	New

	Last Report	Status
<b>6) 9-1-1 Reconsolidation Plan</b>		
a) Tower Transfer to Consortium	Preparing Tower Transfer justification package for EM and Council. Sending grant amendment request to E. Cole for use of current C-GAP grant to pay for consolidation expenses.	Update
<b>7) Transition Activities</b>		
a) Transition Management	New Council Committee structure has been implemented and Council is now meeting twice per month. Council has been engaged in the planning and budget process for FY16-20, adopting updated Vision, Mission and Goals, and participating in a budget workshop led by Dr. Eric Scorsone. Next step will be for Council to receive 5 Year Revenue/Expense projections and adopt budget priorities. Beginning in March, more business items will be sent to Council for consideration. Date specific transition calendar will need to be developed.	Update
<b>8) Other Items</b>		
MDNR and Purchase of CSX rail area	Requesting DNR authorize full amount of appraised property value to be paid by DNR grant.  <b>Note from Planning and Development Director:</b> In brief, the City hired an appraiser for the Grand Traverse Greenway trail to complete acquisition of the CSX properties. We forwarded the appraisal of \$170,000 to the DNR for approval to proceed with negotiations with CSX. During our negotiations, CSX disputed the appraisal and submitted their own appraisal for the property of \$330,000. After reviewing the CSX appraisal, DNR told the City that they would be willing to increase the grant up to \$215,000 for acquisition, but the City would have to make up the difference. After doing additional research on similar properties including acquisition of the Genesee Valley Trail in the City of Flint, we realize that CSX offer is not unreasonable. We asked DNR to reconsider and allow us to have our appraisal amended so that we can fully use the DNR grant for the \$330,000 asking price. (Our DNR grant allocation is \$700,000 more than enough to cover the \$330,000 asking price. Thus far, DNR has been unwilling to provide the additional funding and suggested we talk to MDOT about making up the difference. I think the MDNR is concerned about setting precedent for future trail acquisition, but I don't think it matters if MDOT is routinely paying more.	Awaiting update from Treasury.

DT, Admin, SAM, EM, RTAB Analyst  
 Chief Tolbert, MSP, Fire  
 Harvey Hollins
